> That the members of this Board are of opinion that the time has arrived when recipients of out relief should be permitted a free choice of doctor in case of sickness, that the Ministry of Health be asked to provide therefor by the issue of an Order authorizing the formation of a district medical officer panel subject to such conditions and restrictions as may appear to the Ministry to be necessary

This matter is also referred to at page 389

CATERPILLAR DERMATITIS

DR A S GUBB (Algiers) writes With reference to Dr Castle's remarks on caterpillar dermatitis, in your issue of August 2nd (p 218), it may interest him to know that over here there is a very interesting variety of the hairy caterpillar—the processional caterpillar, so called because they are met with in the spring in series many yards long, nose to tail They are covered with brilliantly and variously coloured long hairs, which are extremely brittle When handled these hairs break off and penetrate the skin, where they set up itching comparable only to that caused by the bristles of the prickly pear (now in season) In subjects with sensitive skins the irritation determines very troublesome urticaria, which may last for several days I saw an instance of this last summer when an American child made pets of some of these caterpillars and suffered in consequence Their nests are conspicuous in the branches of the *Pinus halepensis*—woolly masses the size of a large orange Visitors are warned not to sit under these nests lest some of the hairs should perchance come their way Fabre, the great French entomologist, devotes a delightful chapter to these insects, which are evidently met with in the South of France, where he lived

PHYSICAL EXERCISES FOR RURAL SCHOOLS

THE Board of Education has issued a pamphlet (price 3d) giving information regarding the teaching of physical exercises and games in rural schools Experience has shown that many of the smaller rural schools find difficulty in making a suitable adaptation of the tables given in the Board's Syllabus of Physical Training The difficulty in arranging a satisfactory course of physical training for these small schools is chiefly due to the fact that children of different ages have to be taught together and that facilities are limited The new tables are designed to meet the needs of these small schools, in which the utmost simplicity consistent with adequate results is essential They are constructed primarily for schools with only two teachers, but they can be adapted to schools with three teachers or only one teacher In schools with only one teacher the fullest possible use is to be made of the older children as team leaders The purpose is to give the children exercise—a fact that is often forgotten Active movement is an essential element in physical training, postures and positions are useful only in so far as they ensure that the movement, the essential exercise is of the most beneficial kind In order that the children may be well exercised they need to repeat the movements of the exercises a sufficient number of times and carry them out with plenty of energy Limply stretching the arms sideways a couple of times is not beneficial exercise, and strengthens neither the body nor the will Children come to no harm by working as hard as they can while they are at it, on the contrary, being generally active and alert, that is the way in which they reap the full benefit of their lesson When children play by themselves their output of energy is enormous, and this is Nature's way of securing the healthy development of their bodies Stress is laid upon the necessity for giving free practice in the movements of an exercise The teacher should tell the children what to do, and then let them try it for themselves Accuracy of performance must be insisted on if the exercises are to fulfil their purpose, and this can only be obtained by securing the lively response of the children The team system, whereby the older children who have become skilful in the performance of the exercises are the leaders and almost the teachers of the younger and newer children, is of the greatest advantage, both benefit—the older by the sense of responsibility and leadership engendered, and the younger, who follow an example which cannot always be given by the older and more sedate teachers Tables of exercises and games are given graded according to age and condition Some fault may be found with the manner in which these are set out There is constant reference to other publications The majority of the exercises tabled have appended to them such marks as (S G, p 24) This is a bad practice It requires a possibly overburdened teacher to be constantly referring to another or other documents, the waste of time and energy is obvious It would be far better to make the pamphlet complete in itself The extra cost entailed would be small and the expenditure would be well worth while

VACANCIES

ASHTON UNDER LYNE DISTRICT INFIRMARY—Resident Surgical Officer (male) Salary at the rate of £200 per annum

BRIDGE OF WEIR CONSUMPTION SANATORIA OF SCOTLAND—COLONY OF MERCY FOR EPILEPTICS—Assistant Resident Medical Officer (male) Salary £200 £250

COLCHESTER ROYAL EASTERN COUNTIES INSTITUTION FOR MENTAL DEFECTIVES—Assistant Medical Officer (unmarried) Salary £300 per annum

COVENTRY AND WARWICKSHIRE HOSPITAL—Vacancy on Honorary Surgical Staff

DEVONPORT ROYAL ALBERT HOSPITAL—Resident Male House-Surgeon Salary £150 per annum with £1 1s per week additional while working single handed

EGYPTIAN SCHOOL OF MEDICINE, CAIRO—(1) Professor of Physics (2) Professor of Clinical Medicine (3) Professor of Clinical Surgery (4) Lecturer on Physics Initial salary for (1), (2), and (3) £E 900 a year, in a class £E 900 1,400 and for (4) £E 540, in a class £E 540 840

EXETER ROYAL DEVON AND EXETER HOSPITAL—Assistant Physician

GLASGOW EYE INFIRMARY—Anæsthetist Honorarium £100 per annum

GLOUCESTERSHIRE ROYAL INFIRMARY AND EYE INSTITUTION, Gloucester—Assistant Physician and Pathologist

LANCASHIRE COUNTY MENTAL HOSPITAL, Winwick—Male Assistant Medical Officer Salary £300 per annum plus bonus, at present £140 16s 8d

LEEDS GENERAL INFIRMARY—Resident Ophthalmic Officer Salary £120 per annum

LIVERPOOL SCHOOL OF TROPICAL MEDICINE—Assistant on the staff of the Sir Alfred Jones Research Laboratory, Freetown, Sierra Leone

MANCHESTER ANCOATS HOSPITAL—Resident Medical Officer Salary £175 per annum

MANCHESTER EDUCATION COMMITTEE—Assistant School Medical Officer Salary £600 per annum, rising to £750

METROPOLITAN ASYLUMS BOARD—Assistant Medical Officer at Colindale Hospital, Hendon Salary £500 per annum

NORTHAMPTON COUNTY MENTAL HOSPITAL, Berrywood—Junior Assistant Medical Officer (male), single Salary £350 per annum rising to £450

NOTTINGHAM CITY—Resident Assistant Medical Officer at the Bagthorpe Institution and Infirmary Salary £300 per annum

REDDITCH SMALLWOOD HOSPITAL—Honorary Consulting Gynæcologist

ROCHDALE INFIRMARY AND DISPENSARY—Junior House Surgeon (male) Salary £200 per annum

ROYAL CHEST HOSPITAL, City Road, E C—(1) Physician with charge of Out Patients (2) Resident Medical Officer, salary £150 per annum (3) House Physician salary £100 per annum

ROYAL MANCHESTER CHILDREN'S HOSPITAL, Pendlebury—(1) Resident Surgical Officer, salary £80 per annum for six months, but eligible for re appointment as Resident Medical Officer at salary of £120 per annum (2) Assistant Medical Officer (non resident) at Out patients Department, Gartside Street, salary £150 per annum for six months, but eligible for re appointment as Medical Officer at salary of £200 per annum

ROYAL NORTHERN HOSPITAL, Holloway Road, N—House Surgeon Salary at the rate of £75 per annum

SALFORD UNION INFIRMARY—Third Assistant Resident Medical Officer (male) Salary £275 per annum

SCARBOROUGH HOSPITAL AND DISPENSARY—House Surgeon (female) Salary £150 per annum

SHEFFIELD ROYAL HOSPITAL—Resident Medical Officer (male) Salary £200 per annum

SHEFFIELD ROYAL INFIRMARY—Resident Surgical Officer £200 per annum.

WEST LONDON HOSPITAL, Hammersmith Road, W 6—(1) House Physician (2) Two House Surgeons Males Salary, £100 per annum each

---

CERTIFYING FACTORY SURGEON—The Chief Inspector of Factories announces the following vacant appointment Milborne Port (Somerset)

MEDICAL REFEREE under the Workmen's Compensation Acts 1906 to 1923, for the county of Antrim and the county and city of Belfast Applications to the Secretary Ministry of Labour, 7, Upper Queen Street, Belfast, by September 15th

---

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 23, 26, 27, and 23 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 24 and 25

POST GRADUATE COURSES AND LECTURES

FELLOWSHIP OF MEDICINE AND POST GRADUATE MEDICAL ASSOCIATION, 1, Wimpole Street W 1—*Hospital for Diseases of the Skin* Blackfriars Instruction in the Out patient Department daily from 2 30 p m Venereal Clinic, Tues and Fri, 5 30 to 7 p m *West End Hospital for Nervous Diseases* Daily at 5 p m Mon Tabes Dorsalis Tues, Orthopædic Treatment in Diseases of Nervous System Wed Examination of the Eye in Nervous Diseases Thurs, Hemiplegia and Monoplegia Fri, Investigation of Cranial Nerve Disorders

WEST LONDON HOSPITAL POST GRADUATE COLLEGE Hammersmith, W—Mon, 12 noon, Applied Anatomy Tues, 12 noon Chest Cases Wed, 11 a m, Medical Wards Thurs, 2 p m, Genito Urinary Department Fri, 2 p m, Throat Nose, and Ear Department Sat 10 a m Medical Diseases of Children Daily 10 a m to 6 p m Sat 10 a m to 1 p m, In and Out patients, Operations, Special Departments

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births, Marriages, and Deaths is 9s, which sum should be forwarded with the notice not later than the first post on Tuesday morning, in order to ensure insertion in the current issue

BIRTHS

JOHNSON—On August 21st, at Wykeham House Romsey, Hants, to Madeleine wife of Dr G H Johnson a son

MUSGRAVE WOODMAN—On August 21st at 132 Hagley Road Edgbaston, the wife of E Musgrave Woodman M S, F R C S a daughter

PEEBLES—At Salterley Grange Cheltenham, on August 20th, to Dr and Mrs D J Peebles, a daughter

MARRIAGE

PRITCHARD—COOKE—On August 9th, John Craven Pritchard son of the late C F Pritchard and Mrs Pritchard of 2 The Croft Hampstead, to Rosemary Cooke, I R C P M R C S, daughter of Mr and Mrs Henry Cooke, of 18, Airlie Gardens Campden Hill, W

DEATH

LASCELLES—On August 16th, at his residence Caulfield Farlestown, Banes suddenly of heart failure John Lascelles M B B Ch B A O, aged 32. Buried at Downpatrick Presbyterian Church, August 19th 1924.

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine.

154 **Syphilis and Pernicious Anaemia**

RAHLWES (*Dermatol Woch* June 21st, 1924, p 703) states that although it has been known for a long time that syphilis is sometimes associated with pernicious anaemia the exact relationship of the two diseases has not been discovered Rahlwes therefore reports the following case A man aged 52, who was suffering from fever and severe anaemia, presented the complete blood picture of pernicious anaemia red cells 1½ million per c mm , leucocytes 3,500 haemoglobin 17 3 per cent The spleen and liver were much enlarged , there was no free hydrochloric acid in the gastric juice, the total acidity being 12 , occult blood was absent He had had gonorrhoea at 20, but denied syphilis The Wassermann reaction was, however, strongly positive, and under a course of neosalvarsan, grey ointment, and potassium iodide his condition rapidly improved In three months the haemoglobin count rose from 17 3 to 61 8 per cent and the red cells from 1,200,000 to 4,700 000, while the anisocytosis was greatly improved Three months later he left hospital much improved, but about nine months later he was readmitted and a blood count showed that the red corpuscles had fallen to 1 150,000 per c mm , and the leucocytes to 2,300 , there was much anisocytosis, and the haemoglobin count was 27 per cent The urine was free from albumin, but the deposit contained scattered leucocytes, epithelial cells, and casts, the Wassermann reaction was negative The patient was very anaemic, weak, and exhausted, slightly jaundiced, and the liver was still much enlarged and very hard There was a systolic brut at the heart apex In view of the evidence of syphilis and the great improvement that had followed the previous treatment, another course of neosalvarsan, together with grey ointment and potassium iodide, was prescribed, but the patient failed to respond Signs of heart failure appeared, digitalis and caffeine were tried without success, and the patient died nineteen days after readmission At the necropsy the heart was pale, flabby, and dilated , the aortic intima was irregularly thickened and somewhat rough The apices of both lungs contained hard, blackish masses, each as large as small apples , that in the right apex was free from caseation, but in the left apex there were signs of caseation Pahlwes suggests that pernicious anaemia, while due to some unknown toxaemia, may remain in abeyance for a long period, but that an infection such as syphilis (which is itself capable of producing severe anaemia) sets free some toxin hitherto held in abeyance by the protective mechanism of the organism

155 **Angina Pectoris and Syphilis**

In spite of Disraeli's dictum as to the superlatively deceptive value of statistics, L GALLAVARDIN (*Pre se Med* , July 16th, 1924, p 598) ventures to publish certain deductions derived from an experience of 450 cases of definite angina pectoris He has only included those cases of angina which follow exertion, and has excluded all cases developing in the course of valvular disease Speaking generally, he has found evidence of syphilis in 30 per cent of his cases (including 9 per cent doubtfully syphilitic) Separating these into groups he found 88 per cent syphilitic in cases of angina associated with aortic insufficiency (constant in aortic aneurysm) In angina without aortic lesion the proportion of syphilis sinks to 20 per cent , the earlier the case (that is, below 40 years) the greater the proportion of syphilis In cases of angina with breathlessness after exertion in patients with high blood pressure the evidence of syphilis fell still lower—to 14 per cent These statistics show that it is not right to assume that angina pectoris means of necessity antecedent syphilis, a view taken by some cardiologists

153 **Alcoholism and Tuberculosis**

I W SAMSON (*Deut med Woch* , May 9th, 1924 p 613) medically examined 1,300 prostitutes in Berlin before and during the first part of the war Apart from venereal disease, nicotine poisoning, and the ill effects of temporary, but frequent, sojourns in prisons, the life of a prostitute was fairly healthy, and it was possible to form a comparatively reliable opinion of the relationship of alcoholism and tuberculosis Among the 1,300 there were 384 prostitutes who were more or less addicted to alcohol (29 1 per cent) These drinkers were classified in three groups, according as their consumption of alcohol was moderate, considerable, or excessive Samson discovered 299 cases of pulmonary tuberculosis and found that 66, or 17 2 per cent , of the 384 alcoholics were suffering from tuberculosis, whereas 233 or 25 4 per cent , of the 916 sober prostitutes were suffering from this disease Of the 299 tuberculous prostitutes 66, or 22 1 per cent , were alcoholics, whereas of the 1,001 healthy prostitutes as many as 318, or 31 8 per cent , were alcoholics In other words, the proportion of alcohol consumers was considerably higher among the healthy than among the consumptive prostitutes The author notes that his clinical findings are confirmatory of the report of Johannes Orth, who in 1916 published an account of necropsies performed over a period of ten years on 218 drinkers, most of whom were heavy drinkers Orth found that the heavier the drinker the more likely was the pulmonary tuberculosis to be healed Some what similar findings were published in 1913 by Bertholet of Lausanne, who discovered a slightly lower incidence of tuberculosis in necropsies on alcoholics than on non alcoholics After discussing these and other observations, the author insists that if the campaign against alcoholism is to be rational and efficient it must be supported by scientifically established facts and not by speculative hypotheses which do not bear scrutiny

157 **Acid Sodium Phosphate in Neurasthenia and Graves's Disease**

H J VETLESEN (*Norsk Mag f Laegevidensk aben*, May, 1924, p 337) has for nearly thirty years been giving acid sodium phosphate in cases of neurasthenia, psychasthenia, and general debility, with marked success, but, till he read about Emden's investigations during the war at the Physiological Institute in Frankfurt he felt his advocacy of this drug was only empirical Emden showed in 1915 that the output of work by horses living only on cabbages could be greatly increased by giving them 80 grams of acid sodium phosphate daily, and the bodily and mental vigour of soldiers was also found to be greatly increased by a single daily dose of 5 to 7 5 grams of the same drug The author has given it to several hundred patients with simple goitre, and in most cases has succeeded in arresting the development or actually diminishing the size, of the thyroid gland He has also treated 77 cases of genuine Graves's disease, the total amount of acid sodium phosphate given in the day being 4 grams Ten of these patients subsequently underwent an operation, and one of them, a man was operated on twice He returned to the author showing marked signs of Graves's disease, great exophthalmos, and a pulse of 158 On palpation there seemed to be nothing left of the thyroid gland. The author gives acid sodium phosphate for months and even years, with short intervals, and has never seen intolerance to it On the other hand, he has found it an excellent sedative, the pulse rate declining and tremor disappearing He has even known exophthalmos diminish or disappear under this treatment

158 **Chronic Haemorrhagic Gastritis**

L URRUTIA (*Arch de med , cir y esp* , March 1st, 1924, p 377) states that, in addition to acute erosion due to circulatory disturbances intoxications, infections, etc , there is a group of chronic erosions of the stomach which was described by Einhorn in 1894 This group is characterized by chronic pain, which is usually not intense, occurring immediately after meals, but not connected with their quality, and lasting one to two hours It is rarely continuous, and may appear independently of food There is also debility and loss of flesh The course is chronic and relapses are frequent The gastric chemistry does not show any specific characters although diminution of acidity is the rule and hyperchlorhydria is exceptional There is abundance of mucus in the gastric contents, but the essential diagnostic feature, according to Einhorn, is the constant presence of small particles of the mucous membrane in the stomach washings which are usually clear and only exceptionally cloudy The probable cause of these erosions which have not been demonstrated anatomically, is in the majority of cases chronic gastritis In 1900 Pariser published similar cases but accompanied by intense pain diffused throughout the stomach, and insisted on the regular presence of small pieces of mucous membrane in the stomach washings attributing the symptoms to ulcerative gastritis These findings were subsequently confirmed by many other observers such as Ewald Boas, Albu Straus, and Knud Faber, and Urrutia himself has seen about half a dozen examples The prognosis of erosive gastritis is good The treatment consists in washing out the stomach with a 1 per 1 0.0 solution of silver nitrate and in the administration of large doses of bismuth In addition to Einhorn's

disease—as it is called by Muntz—Nauwerk, Mathieu and Sansoni have described a chronic ulcerative anachlorhydric gastritis characterized by large or small gastric haemorrhage, but without any ulceration being found *post mortem*

159 The Initial Fever in Tertian Malaria

P C KORTEWEG (*Nederl Tijdschr v Geneesk*, April 12th, 1924, p 1622) records his observations on the initial fever in cases of general paralysis inoculated with tertian malaria in the clinics of K H and L Bouman at Amsterdam From September, 1921, to the end of November, 1923, 66 patients were inoculated, two of them twice, as no result followed the first inoculation In 52 cases a careful examination of the blood was made for the first appearance of *Plasmodium vivax*, and it was found that it never appeared before the fifth day or later than the twenty first day after inoculation, and that it was most frequently present between the sixth and twelfth days Usually there was no constitutional reaction directly after the inoculation, but in about a third of the cases there was a rise of temperature to 100 4° or 102 2° on the day of injection, or one or two days later This rise of temperature had nothing to do with malaria, and entirely disappeared within a few hours The malarial pyrexia began about the same time as the plasmodia were first found in the blood Among 37 cases Korteweg found that the plasmodia appeared before the rise of temperature in 13 on the same day and in 6 afterwards The character of the initial fever in 63 cases was as follows in 36 it was a continued remittent, in 12 intermittent, and in the rest irregular

Surgery.

160 Diagnosis of Ruptured Urinary Bladder

R T VAUGHAN and D F RUDNICK (*Journ Amer Med Assoc*, July 5th, 1924, p 9) describe a new way of diagnosing rupture of the urinary bladder sufficiently early to forestall peritonitis A small rubber catheter is passed through the urethra with the usual asepsis If the bladder is ruptured a few cubic centimetres of blood or blood stained urine usually escapes The catheter is fastened temporarily in the urethra by means of adhesive strips, and the patient is examined by *x* rays Air is introduced through the catheter into the bladder by means of a hand bulb, about 50 to 100 c cm being ample, though more may be introduced if desired In the case of intraperitoneal rupture the air is seen to escape into the abdominal cavity, and, with the patient lying on his left side, it accumulates immediately under the peritoneum, allowing the bowel and liver to fall away from the right abdominal wall If the patient sits up this free air is seen to collect between the diaphragm and the liver In extraperitoneal rupture the air escapes into the loose tissue around the bladder, and is seen to spread along the fascial planes outside the peritoneal cavity In cases without rupture the air accumulates in the bladder, distends it, and the regular vesical outline is produced The authors describe in detail the treatment of five cases, and point out the value of differentiating between intraperitoneal and extraperitoneal rupture, the surgeon being able in the latter case to avoid opening the peritoneal cavity They do not think that there is any added risk to the patient either from air embolism or from infection, and no discomfort is caused

161 Modern Treatment of Bone and Joint Tuberculosis

G R GIRDLESTONE (*Journ Bone and Joint Surg*, July, 1924, p 519), discussing the modern treatment of tuberculosis of the bones and joints, points out that while a tuberculous focus in a bone or joint is part of a deeply rooted disease and evidence of a pre existing infection of the body, which is advancing and gaining the upper hand, modern treatment by rest, diet, open air, and sunshine, if continued for a sufficient length of time, will almost always effect a cure, which after care measures can render permanent The necessity for such skilled after care is shown by the frequency of relapses when the patient is discharged from hospital to unsatisfactory home surroundings unless continuous after care supervision is maintained, with prompt readmission when necessary Treatment aims at raising the patient's general vitality, health, and powers of resistance, the elimination of any factors harmful to the diseased part, the avoidance of septic infection, and the restoration of function, all of which require rest, good feeding, open air, and sufficient time In the application of heliotherapy the gradual exposure of the body is important in order to develop pigment, which, by protecting the deeper layers of the skin and underlying tissues from the photochemical effect of sunlight, allows the patient to respond better to treatment While the sun heats and the wind cools, active hyperaemia of the skin is promoted and metabolism stimulated—the wind causing a reflex stimulation of the deep organs from the skin In providing rest splintage should hold the parts accurately and comfortably in position without constricting the circulation or interfering with respiration, while allowing exposure of the affected part to the sun and air together with as much exposure of the rest of the body as possible During active disease perfect un interrupted surgical rest is indicated, but with the cessation of all pain and spasm comparative immobilization permitting of minor movements should be adopted A cold abscess, the fluid of which is harmless, should only be aspirated if the skin is threatened, it should never be opened and drained

162 Nephrectomy for Bilateral Renal Tuberculosis

G EKEHORN (*Hygiea*, June 15th and 30th, 1924, pp 353 and 386) is in favour of removing the more diseased kidney in cases of advanced bilateral renal tuberculosis when there are grounds for believing that it is responsible for severe pain and fever Among about 200 cases of renal tuberculosis he has observed 27 advanced cases (24 males and 3 females) in which he could not carry out every exploratory test, such as catheterization of the ureters, cystoscopy, etc In these cases he directly explored the kidneys by operation, and in 7 cases found the conditions to be unsuitable for nephrectomy He performed this operation in the remaining 20 cases, the exploration of the kidney on one side and the nephrectomy on the other being undertaken at the same time The wounds were closed at once and healed uneventfully Almost all the 20 patients responded to this treatment by an improvement in their condition, pain diminishing, and the urine becoming clearer They were operated on between 1910 and 1922, and an inquiry conducted in the autumn of 1922 showed that 10 were dead, 5 could not be traced, and 5 were still alive Among the survivors there were 2 whose operations dated back twelve years They were still fit for work and complained of no pain The urine contained no albumin, but they still had to micturate more than once during the night A third survivor, operated on five years earlier, could also work as before and had no pain Of the 10 patients who were known to have died, one had lived six years after the operation, and another two years It would thus seem that, in selected cases, nephrectomy may be more than temporarily beneficial in cases of bilateral renal tuberculosis

163 Erect Dislocation of the Shoulder

F S LYNN (*Surg, Gynecol and Obstet*, July, 1924, p 51) draws attention to the frequency of dislocations of the shoulder, whilst the number of erect dislocations of the joint is small In some clinics no cases of the latter have been recorded, none occurred among 539 shoulder dislocations at St Thomas's Hospital, London This dislocation is a variety of the subglenoid, and the head of the bone is always found against the side of the chest There are three cardinal symptoms (1) elevation of the arm, (2) fixation in this position, and (3) pain, increased by any attempt to lower it The forearm is usually flexed and resting on the top of the head The fixation of the arm in this position is explained by the tenseness of the anterior and posterior parts of the capsule, whilst the long head of the triceps also fixes the head of the bone The ages of the patients range from 21 to 60 years If over 60 there is usually a fracture because of the brittleness of the bone For the actual production of the dislocation violent force is not necessary, when it occurs the bone is usually abducted or extended and the forearm pronated, occasionally nerve injuries may be present Reduction by upward traction of the arm has been successful in most cases It has been possible to collect records of 28 cases, and the author reports 3 further cases

164 A Case of Congenital Megacolon

A BERGE, CHEVRIER, and P LEFÈVRE (*Bull et Mém Soc Med des Hop de Paris*, July 17th, 1924, p 1111) record an example of enormous congenital dilatation of the colon in a boy aged 15 years When admitted his abdomen was much distended and he was slightly cyanosed on exertion He had not passed faeces for three weeks, but much flatus was escaping From birth he had been troubled with constipation Faecal vomiting set in, and the abdomen was opened for obstruction The patient died ten days later, he had passed no faeces naturally for thirty eight days At the autopsy the colon was found enormously dilated—20 in long, 11 in wide, and 21½ in in circumference—the lungs and heart being pushed high up behind the sternum There was a large mass of retained faeces weighing 30 lb, and a hydronephrosis due to pressure of hard faeces in the pelvis Histologically the colon showed hypertrophy of the walls, especially of the circular layer, and a growth of connective tissue in all the planes, more particularly in the mucous layer, where epithelium had completely disappeared A diagram of the abdomen shows clearly how enormous the colon was

Ophthalmology

165 **Papilloedema.**

W A HOLDEN (*Arch of Ophthalmol*, July, 1924 p 316) in this paper emphasizes the fact that true papilloedema due to raised intracranial pressure almost invariably leads to blindness unless a decompression operation is done It is necessary, though often difficult, to distinguish between papilloedema, papillitis, and pseudo-neuritis In papilloedema the nasal border of the disc becomes blurred first and the temporal border last, the disc becomes elevated to as much as 3 to 5 dioptres of swelling, the physiological cup becomes obliterated, and haemorrhages appear Papilloedema is rare in myopic eyes, and does not develop in an atrophic nerve Vision is for some time unaffected and the visual field remains full, though the blind spot is enlarged Later, contraction of the field, first on the nasal side and then concentrically, occurs with reduction of central vision Papilloedema is essentially a non inflammatory process, and is associated with increased pressure of the spinal fluid, as can be shown by lumbar puncture Papillitis is a true inflammation of the disc and is usually unilateral The swelling of the disc rarely exceeds 2 dioptres but there is generally considerable oedema of the surrounding retina Vision fails early the first changes being enlargement of the blind spot and a central scotoma The common causes of the condition are nasal sinusitis and inflammation of the orbit The spinal fluid is not under pressure Pseudo-neuritis is seen in high hypermetropia, it is an anatomical condition, and remains stationary there is slight swelling of the disc, but no oedema and no haemorrhages

166 **Retrobulbar Optic Neuritis of Ethmoido-spheno dal Origin**

G POPTMANN and P PESME (*Rev de Laryngol, Otol et Rhinol*, May 15th, 1924 p 283) describe two cases of retrobulbar neuritis in which the sphenoidal and posterior ethmoidal sinuses contained pus and granulation tissue In each case there was a small but absolute central scotoma In one there was marked papillitis with a red disc, some swelling, and engorged vessels, in the other the changes in the disc were much less marked Operative treatment of the sinuses caused a very rapid recovery to almost normal sight The central scotoma is the subjective phenomenon of a lesion of the papillo macular bundle The term retrobulbar, or better retro ocular, neuritis is fittingly applied to inflammation of the papillo macular bundle, and is distinguished from a descending neuritis, which does not give rise to a central scotoma The disc in the latter type shows a discoloration of the temporal portion, which is due to atrophy of the macular bundle this type corresponds more to that which follows intoxication by tobacco and by alcohol The neuritis provoked by diabetes and by syphilis is usually bilateral, is accompanied by other signs of the disease, and has a less acute onset In the cases described the central scotoma is accompanied by the condition of papillitis, and this association of symptoms and signs, which is apparently only found in cases which follow posterior sinus suppuration, should always lead to investigation of the sinuses

167 **Leber's Disease**

BAUDOT (*Rev med de l Est*, May 1st, 1924, p 296) records a case of Leber's disease or hereditary optic atrophy The patient was a man, aged 23, who sought advice because his vision had been getting progressively weaker for the last two years, so that he was unable to walk without a guide At the onset he had had some transient frontal headache On examination the reaction to light was diminished, but the reaction to accommodation and convergence was preserved in both eyes The cornea, iris, lens, and media were normal in both eyes, which showed slight myopia Visual acuity in both eyes was reduced to perception of light The fundi showed well marked bilateral optic atrophy The Wasser mann reaction was negative On inquiry, a history was obtained of five other similar cases in the family—namely, a maternal uncle affected at 33, his two cousins, male and female affected at 24 and 25 respectively, a son of the female cousin affected at 13, and the patient's maternal great uncle in whose case the date of onset could not be ascertained The present case corresponds to the description of the disease given by Leber under the name of "familial retrobulbar neuritis" in presenting the following characters greyish white atrophy of both papillae with regular margins, dyschromatopsia for green and the absence of any cause such as intoxication infection or cranial deformity The date of appearance of the atrophy, both in the patient and the other affected members of the family corresponded to the average age, which ranges from 13 to 33, with a maximum between 21 and 25 The character of the disease was distinctly hereditary, as five persons were affected in three generations Males are affected in preference to females, only one of the five being a female in the present case In spite of the absence of a history of syphilis slight improvement took place after treatment by bismuth

168 **Intrinsic Ocular Paralysis after Acute Infections**

J DE J GONZALEZ (*Amer Journ of Ophthalmol*, May, 1924, p 351) suggests that these late paralyses coming on after acute infectious diseases may be due to a non specific substance which is possibly a by product of the chemical defensive substances elaborated by the body against the toxins of the infectious disease Significant facts in support of this idea are that the paralyses usually occur in the second or third week of convalescence, when it might be supposed that any direct action of the infecting organisms and their toxins would be absent that it is more often in the mild cases of the diseases that the paralyses occur, and that when the paralysis has appeared curative serums have little or no effect upon its progress The hypothetical paralysing substance he likens to a drug, such as atropine or nicotine, and thinks that its specific site of action is the neuro-muscular synapse

Obstetrics and Gynaecology.

169 **Are Ovarian Extracts Therapeutically Useful?**

M R ROBINSON and B ZONDEK (*Amer Journ Obstet and Gynecol*, July, 1924, p 83) cast further doubt on the specificity of the effects produced by administration of extracts of ovarian substance Their experimental work was carried out in virgin guinea pigs previous investigators, they think have not attached sufficient importance to the fact that animal genital organs show marked seasonal variations in size and blood content, and they have relied on naked eye inspection rather than the weight of the uterus as compared with the total body weight Proprietary ovarian products produced after tryptic fermentation were found uniformly ineffective, but chemically de albuminized products from time to time produced uterine hypertrophy Chemically de albuminized extracts of testis, pineal gland, and thymus were equally effective in some cases but extracts of the anterior lobe of the pituitary gave no results Parenteral injections of an albuminoid mixture, such as sterilized milk, were as successful as 'ovarian therapy' in inducing uterine hyperplasia Testing the biogenic amino bodies the authors found that guanidine, arginin, tyrosin, and tyramin were ineffective, histamine, alone or in a proprietary product combined with tyramin, brought about with fair regularity enlargement of the uterus The general conclusion drawn is that genital growth may be stimulated by administration of non specific amino-bodies which are the result of protein decomposition, as well as by the so-called specific extracts To obtain a true endocrine effect with ovarian extracts is impossible for in the process of preparation the active principle is destroyed any slight therapeutic success is obtained by non specific means

170 **Rupture of the Uterus.**

D S HILLIS (*Surg, Gynecol and Obstet*, July 1924, p 32) reports four cases of ruptured uterus encountered in eight months There was a striking similarity between these cases in all of them the rupture occurred during pregnancy, and occupied the site of a Caesarean section scar In each case the uterus was removed and the patient recovered He draws the following conclusions from the study of these cases The scar of a Caesarean section may rupture not only during the course of labour but at any time during the last three months of pregnancy The localization of the placenta over the scar seemed to have no influence in two cases fragments of syncytium were found over the scar while in the two other cases no sign of placental tissue could be seen at the site of the scar In one case there may have been a traumatic cause, since the patient fell down in a faint before the pain began, in the three other cases severe and sharp pain was the first symptom noted, and in one case the rupture occurred while the patient was asleep The rupture in the scar allowed the uterus to empty completely and good contraction and retraction followed stopping the haemorrhage In no case was there external bleeding because labour had not begun and the cervix was closed The line of rupture in each case was in the scar tissue, and the contraction of the uterus held the edges of the wound so far apart that they could only be approximated with great difficulty The author considers it advisable to remove the uterus in these cases owing to the

171 Treatment of Progressive Phthisis during Pregnancy

J MISGELD (*Zentralbl f Gynak*, June 28th, 1924, p 1438) has followed Bumm's advice, and during the last fifteen years has treated 56 cases of advancing phthisis in pregnant women by hysterectomy and double salpingo oophorectomy During the same time 46 patients with phthisis have been treated by induction of abortion, and the results are compared, showing the operative treatment to be markedly the better Thus the mortality for operative cases was 28 2 per cent, as compared with 37 per cent for induction, 3 5 per cent remained unbenefited after operation, 17 per cent after induction, only 3 4 per cent became worse after operation, whereas 35 5 per cent deteriorated after induction Post operative symptoms, such as flushings, etc, were not frequent, and in the worst cases only lasted for a year at the most The author states that the condition warrants this somewhat drastic treatment, since pregnancy is the worst complication which can affect the tuberculous woman This, according to Winter, is due to the increased need of oxygen and nutriment during pregnancy, the frequent accompaniment of hyperemesis, and the increased chances of mechanical spread of infection During labour tubercle bacilli pass readily from the placental site into the blood, and the loss of blood is a weakening influence In the puerperium exhaustion from loss of lochia and blood, and, above all, from lactation, causes the disease to progress rapidly Phthisis is also aggravated during sexual life, increased sexuality causing rises of temperature Misgeld adds that the following conditions are to be observed before operation should be undertaken (1) No cavities must be present in the lungs (2) The woman must be normal mentally (3) The pregnancy must be under four months' duration, if over six months operation is contraindicated, as also is induction (4) The woman, if possible, should have several living children With these provisions the author is in entire agreement with Bumm that hysterectomy, together with the removal of the appendages, is the best method of treatment

Pathology.

172. Bacteria of the Stomach Duodenum, and Bile Ducts

F VIRGILLO (*Arch Ital di Chir*, June, 1924, p 393), as the result of his investigations in the Surgical Clinic of Padua University, has come to the following conclusions (1) There is a slight difference in the results obtained from examination of the gastric contents removed by Einhorn's tube as compared with direct examination of the contents during gastro entero anastomosis By the former method the contents were found to be sterile in 19 per cent and in the latter in 23 5 per cent After extraction with Einhorn's tube the gastric contents were found to be sterile in 1 out of 4 cases of duodenal ulcer, in 2 out of 6 cases of pyloric stenosis due to gastro pyloric or pyloro duodenal ulcer, and in 2 out of 9 cases of disease of the bile ducts The gastric contents always showed an abundance of organisms in carcinoma of the stomach Direct examination of the gastric contents during gastro entero anastomosis showed that they were sterile in 1 out of 2 cases of active gastric ulcer and in 2 out of 5 cases of duodenal ulcer There was an abundance of organisms in 7 cases of pyloric stenosis and carcinoma of the stomach (2) In normal subjects removal of the gastric contents with Einhorn's tube showed that they were sterile in 2 out of 3 cases (3) No definite relation could be established between the amount of free hydrochloric acid and the bacterial content of the stomach (4) After gastro entero anastomosis the gastric flora remained unchanged for the first fifteen or twenty days after the operation (5) The duodenal contents removed by the Eustachian tube were found to be constantly sterile in normal subjects and in 1 out of 2 duodenal ulcers In pyloric stenosis there was a development of staphylococci in one case, and in gastric carcinoma organisms were always present In affections of the bile ducts the duodenal cultures were sterile in 3 out of 13 cases (6) The contents of the gall bladder in cholelithiasis, cholecystitis, and pericholecystitis were sterile in 11 out of 21 cases (7) Comparison of the bacterial flora of the duodenum before and after cholecystectomy showed that the duodenal fluid was sterile in 23 per cent before cholecystectomy and in 0 per cent after the operation (8) The cores of the calculi contained in the gall bladder were sterile in 20 per cent (9) The contents of the first loop of the jejunum were sterile in 20 per cent (10) The organisms most frequently found were staphylococci, streptococci, *B coli*, a coliform organism, pseudo diphtheria bacilli, saccharomycetes, and *Oidium albicans* Staphylococci predominated in the stomach, and saccharomycetes and *Oidium albicans* were usually attached to the mucosa In the duodenum streptococci and staphylococci were present in equal amounts, and a few bacillary forms were seen In the first loop of the jejunum coccal and bacillary forms, especially *B coli*, were present in equal amounts (11) The presence of the typhoid and paratyphoid bacillus in the gall bladder and duodenum is of special importance in non pathological conditions (12) In all the cases studied the virulence of the organisms was very slight or *nil*

173. Early Changes in the Pancreas after Death

G CAMERON (*Med Journ of Australia*, May 31st, 1924, p 537), from investigations into the changes occurring in the pancreas during the first eight hours after death, found that the islet cells begin to shrink, becoming less defined in outline with alterations in the nuclear staining, the acinar cells showing similar changes in less degree, and signs of the nuclear material being discharged into the cytoplasm The earliest changes are seen in the granular cells, which are classed according to the proportion of granules and the depth with which they stain, and changes in their shape and the appearance of the nuclei The most granular cells gradually alter into that class of cells where granules are less or no longer distinguished Following on these changes alterations in the nuclei occur, so that the granular cells still further resemble the non granular, and destruction of whole islet cells occurs, leaving empty spaces, while the acinar cells lose their granules more slowly, these being more resistant to autolytic and other enzymes than the islet granules Islet granules disappear some time before nuclear changes are seen, so that they are of a very unstable character These early *post mortem* changes are identical with those resulting from disease, so that unless the pancreas can be examined within four hours of death its pathology must remain obscure From these investigations it appears that the most important changes after death occur within the first eight hours, owing to the cutting off of the blood and the starting of autolysis by ferments Zymogen granules are much more resistant to changes than other granules, and the similarity of early changes in the islets to those occurring in experimental and human diabetes is apparent

174. Experimental Epidemic Encephalitis and Herpes

G AURIAT and P E F SAINTE MARIE (*C R Soc de Biologie*, June 13th, 1924, p 46), as the result of their experiments on rabbits, come to the following conclusions (1) For a long time after the acute stage of epidemic encephalitis the cerebro spinal fluid retains its virulence, although in an attenuated form (2) A virus of encephalitis and herpes of weak virulence, after inoculation of the rabbit's cornea, may produce chronic lesions of the brain without previous keratitis or other clinical symptoms If, as some writers hold, the virus of encephalitis is distinct from that of herpes, the lesions in inoculated animals do not show any evidence to justify such a differentiation

175 To Prevent Decomposition of Specimens of Urine.

T BRANDT and R C STORSTAD (*Norsk Mag f Laegevidenskaben*, June, 1924, p 456) point out that when the urine of a diabetic is collected during twenty four hours decomposition of some of its contents may stultify an analysis Yet an analysis of only one sample of urine is unreliable, since the contents of the urine vary during the twenty four hours The authors have tested a variety of disinfectants, including thymol, toluol, xylol, chloroform, and mercury perchloride, and they note that several common disinfectants, such as formalin and carbolic acid, are unsuitable for this purpose because they act as reducing agents Other disinfectants, such as thymol, might serve the desired purpose were the problem merely bacteriological, but it has been observed that with the same quantitative and qualitative bacterial contamination the rate of decomposition of various urines differs enormously The problem is therefore physical and chemical, as well as bacteriological The authors have found that there is practically no ammoniacal decomposition taking place in a urine with a *p*H below 5, even when the urine is kept in a thermostat for twenty four hours Many disinfectants being expensive as well as unreliable, it would seem wiser to abandon them in favour of simply altering the hydrogen ion composition of the urine by the addition of a little acid, which prevents the *p*H becoming less than 5 As long ago as 1886 Muller recommended adding acids to urine to prevent bacterial decomposition, and the explanation of this process at that time was that the acid acted as a germicide The authors consider that any acid may be used for this purpose, provided it is not nitric acid, which destroys several organic substances Sulphuric acid and hydrochloric acid are excellent for this purpose, and about 15 c cm of hydrochloric acid should be added to every litre and a half of urine The chief advantages of acids over disinfectants are that the former cost less, are readily soluble, and act with greater certainty over a short period.

THE DEESIDE SANATORIA IN SCOTLAND

FOR THE OPEN-AIR TREATMENT OF

PULMONARY TUBERCULOSIS and ALLIED DISEASES

At BANCHORY and MURTLE

Medical Director - - DAVID LAWSON, M A, M D, F R S E

Prescription Glaxo

The need of a dried milk with a low protein content has long existed and is now successfully met by the introduction of PRESCRIPTION GLAXO

It can be seen from the following analysis that PRESCRIPTION GLAXO, when reconstituted with hot boiled water—1 in 8—(one part of powder made up to eight parts with boiled water allowed to cool to about 160° F) gives a milk with a protein content as low as that of human milk

ANALYSIS OF PRESCRIPTION GLAXO (when reconstituted 1 in 8) as compared with average breast milk

GLAXO (Medical Dept) 56 OSNABURGH STREET LONDON N W 1

"I have found a New Cure effected by Sphagnol Soap."

Here is further convincing testimony of the efficacy of Sphagnol in relieving Skin Trouble to add to the thousands of recommendations we have received from Medical men in every corner of the country

DEAR SIRS,—I have given your Sphagnol Soaps a good trial and I may say that I have found them excellent in many respects I think I may claim to have found a new cure effected by your soap

Personally I have suffered for a long time from persistent scurf which has caused my hair to become alarmingly thin I used your soap several times as a shampoo and I was struck by the rapid disappearance of scurf that I recommended the treatment to a friend He found the same beneficial effect in his own case To test the real efficacy of the treatment we used ordinary soaps for shampooing for a month or so and the scurf returned with renewed vigour—to be subsequently subdued by a return to Sphagnol shampoos

Yours faithfully —— M B Ch B

DIBROMIN

A POWERFUL NEW GERMICIDE

(DI BROM MALONYL-UREIDE)

For
Irrigations,
Wet Dressings,
Moist Gauze
Packings,
Douches,
Gargles,
etc etc.

DIBROMIN is a white, crystalline synthetic compound containing approximately 56 per cent of bromine in loose chemical combination When its solutions are brought into contact with infected tissues, the bromine is slowly liberated, and exerts a destructive oxidising effect on micro organisms, similar to that produced by chlorine

Dibromin possesses all the advantages claimed for chlorinated compounds and solutions, and in addition the following —

It is stable in dry form solutions are easily made, are definite in strength and are non-irritating

The phenol coefficient of Dibromin tested on the typhoid bacillus, is 105, and no less than 213 on the *Streptococcus hæmolyticus* Its solutions do not coagulate serum or tissue albumin, and even a saturated solution in water has proved so innocuous that its toxicity is practically negligible

The preparation of Dibromin for use consists simply in dissolving the crystals in water, and the ease with which solutions are prepared is in striking contrast with the difficulties experienced in the preparation of certain of the liquid chlorinated compounds

Supplied in bottles containing either 10 or 50 capsules each capsule containing 6 grains Literature and sample will be sent to physicians on request

SQUIRE'S COMPANION

TO THE

BRITISH PHARMACOPŒIA.

Published by J & A CHURCHILL, 7, GREAT MARLBOROUGH STREET, W 1

THE BRITISH MEDICAL JOURNAL says "*SQUIRE'S COMPANION is a work of great practical value to medical practitioners as well as to pharmaceutical chemists, dispensers, and pharmacologists No labour has been spared to make the COMPANION a complete scientific and practical adjunct to the BRITISH PHARMACOPŒIA*"

THE PHARMACEUTICAL JOURNAL says "*A companion in the true sense of the word, to the official book*"

THE PRESCRIBER says "*The pharmaceutical portion is perhaps the most complete in the language Neither medical man nor pharmacist can afford to be without the latest edition of SQUIRE'S COMPANION*"

THE HON BETTY ON THE MOORS

We would remind doctors that we welcome them in our Showroom and Demonstration Rooms when ever they desire to supervise the testing of their own patients

GENERAL ACOUSTIC COMPANY,
63b Acousticon House 18, Hanover Street Regent Street London W 1

THE HON BETTY And you really do agree that there is no other Hearing Aid comparable with an Acousticon?

THE AURIST That it is clearly the best Hearing Aid yes I have thought so young lady since before you were born, probably

HON B But do you think it is the most *popular* Hearing Aid?

THE AURIST I cannot really say—I should imagine that it quite probably is Most of my own patients entertain no doubt on the point. I can speak for them.

HON B It must be wonderful to have such power as you have. I spend my life persuading people to test Acousticon Aids but my enthusiasm is a weak force compared with that which you possess

THE AURIST Well if you spend your time in making the deaf take an intelligent interest in Hearing Aids you are doing more useful work than most people can lay claim to

HON B Thank you!

THE
New Jaeger Underwear

A Consulting Physician writes —

In my opinion this invention of a Two-layer Stockinet weave constitutes a distinct advance The layers are so ingeniously woven that for all practical purposes the material behaves as a single fabric, whilst the air contained within the meshes acts as a bad conductor of heat renders the garments more hygienic and at the same time lighter in weight than their somewhat bulky winter weight predecessors

In wear the fabric is warm and comfortable, and the texture is fine enough not to be irritating"

SPECIAL TERMS TO HOSPITALS

Intestinal Disinfection

No. 5

RHEUMATOID ARTHRITIS

UNDER this name several conditions which are ætiologically distinct are doubtless grouped together, and we are still far from a solution of the cause of the disease

It is obviously impossible to restore in any marked degree mobility to the joints of the hopelessly crippled, but in the early stages much may be done to retard or stop the progress of the disease.

An eminent surgeon has directed attention to the *rôle of chronic intestinal* stasis and alimentary toxæmia in the production of the disease, and has emphasized the want of a reliable intestinal antiseptic

Fortunately in the active principle of Kerol this want is met. Kerol is a potent and non-toxic germicide which is unabsorbed from the intestine, so that the whole of its germicidal power is exerted upon the contents of the bowel

For intestinal disinfection, use Kerol Capsules (keratin-coated), they contain three minims of Kerol. One to three Capsules may be given three or four times a day after meals

KEROL CAPSULES

Please send for literature and samples which will be sent free to any member of the Medical Profession

KEROL LTD (Successors to Q-ol-I Bros Ltd.)
100, Castlegate, Newark

Trufood is standardised as regards each constituent and contains an unvarying 26 % of butter fat

There is a mass of clinical evidence to prove that Trufood is a satisfactory substitute for human milk.

Trufood is a scientific alternative for human milk

Whatever claims are made for other infants' foods none when subjected to the test of analysis, can show a closer approximation to breast milk than Humanised Trufood The latter as the following figures clearly prove, makes available for the first time a product which whilst containing nothing but the solids of milk, is practically identical in composition with human milk, when reconstituted with water

	Breast Milk	*Cow's Milk*	*Humanised Trufood*
Lactose	6 5	4 7	6 25
Fat	3 3	3 5	3 45
Casein	0 9	3 0	0 80
Lactalbumen	0 4	0 3	0 60
Salts	0 2	0 8	0 65
Water	88 7	87 7	88 25
	100 0	100 0	100 0

Freedom from starch —No starch or products of starch conversion occur in Trufood The only carbohydrate present is milk sugar This is of importance since all authorities are agreed that starch, whether free or converted, is harmful in infant feeding The child fed on Trufood digests its food well shows steady growth of bone and muscle and develops sound healthy flesh and not unhealthy fat

You are invited to apply for reproduction of actual photograph (in colours) of a recent incubation test of various milks This is obtainable either by post or at the TRUFOOD STAND (Nos 122/3 and 132/3) at the London Medical Exhibition

Samples adequate for full clinical trial, together with descriptive literature, on request

HALITOSIS

(AS DEFINED IN THE CENTURY DICTIONARY)

(Hal i to-sis) N N L

(L. Halitus—Breath Osis—Offensive)

Offensive breath, whether arising from diseased or neglected conditions of the teeth, mouth or nose or caused by disorders of digestion, respiration, the excessive use of tobacco, etc., may be readily overcome by the deodorizing properties of—

LISTERINE

Listerine is strictly antizymotic, it inhibits alike the acid fermentation of carbohydrates and the alkaline putrefactive processes of mixtures of meat and saliva, retained as debris about the teeth, hence, Listerine is antagonistic to the activating enzymes of fermentation so often the cause of Halitosis

The volatile antiseptic constituents of Listerine-thyme, eucalyptus, gaultheria and mentha, combined with baptisia, boric acid, rectified spirits and water have a stimulating effect upon the stomach and in proportion to the dose, an action inhibitive to fermentation of its contents, hence, *Listerine is often corrective of those disorders* associated with the endo-development of gases and acid eructations A large tablespoon of Listerine in a wineglass of hot water will afford immediate relief.

Why No Alkali

No Soap—No Chalk—No Magnesia

Pepsodent is mildly acid, to comply with requirements of modern authorities

Mild acid increases the flow and fluidity of the saliva, to better wash the teeth.

It increases the alkalinity of the saliva, to better neutralize mouth acids

It increases the ptyalin in the saliva, to better digest starch deposits

It acts to curdle fresh mucin plaque, and to disintegrate it at any stage of formation

Anything alkaline has just the opposite effect. It sacrifices these desirable results for a momentary alkalinity

How fruit protects

Eating a mildly acid fruit multiplies the salivary flow It multiplies the alkaline index and the ptyalin index of the saliva.

People whose diet consists largely of fruit are notably less subject to caries Some, like the Sicilians, are almost immune

That fact led to research by very high authorities And that research developed the principles on which Pepsodent is based. This tooth paste, in a degree, brings effects like fruit

Eight years of tests

Pepsodent has for 8 years been subjected to the most exhaustive tests All its unique benefits have been proved beyond question.

If you are not familiar with these tests and their deductions, please ask for our literature. For your own sake and for others, you should know the whole truth about Pepsodent. Please send coupon

KOLYNOS DENTAL CREAM
(Made in England)

The properties desirable in a dentifrice have been specified as follows, viz. :—

Antiseptic	Harmless to mucous membrane
Pleasant flavour	Non-poisonous to the user
Mildly Alkaline	Must not alter reaction of the saliva
Contains chalk as an abrasive	Must not destroy salivary ferments
Contains soap as an emulsifier	Must not inhibit the secretion of saliva

Fourteen years of varied and painstaking laboratory experiments with the wide and ever increasing endorsement of the profession have demonstrated that these qualities are embodied in KOLYNOS DENTAL CREAM

Liquor Pepticus (Benger)—*"A digestive agent of extraordinary power."*

—Sir William Roberts M D F R S.

Benger's Liquor Pepticus, the preparation referred to, is a concentrated and highly active fluid pepsine in acid solution which acts particularly upon meat, eggs and other proteid foods

It is odourless and tasteless, and can be prescribed with medicaments of a tonic nature which are free from astringency and alkalinity

In 4, 8 and 16-oz bottles

Essence *of* Rennet Concentrated (Benger).

The highest quality sweet essence, for professional use in Infant and Invalid Feeding It is therefore the ideal agent for the precipitation of curd and the production of whey, which can then be safely used for diluting the milk for young infants

Whey thus prepared with Benger's Essence of Rennet is of the greatest value in the treatment of diarrhœa, vomiting, etc , and can be used with perfect safety and good results

Benger's Essence of Rennet makes splendid junket, which agrees with many who cannot take milk, and is useful for older children

Benger's Essence of Rennet was specially prepared for H Ashby M D for producing whey in Infant Feeding (see his books)

In 9d and 1/6 bottles
Larger sizes for hospitals, etc , use

TRADE MARK **ALOCOL** BRAND

Colloidal Hydroxide of Aluminium

Modern medical experience has proven that while the usual alkalis and oxides possess power for neutralizing the normal or abnormal acids of the stomach their action is only symptomatic and transitory They may give momentary relief to the painful condition but they also have the effect of aggravating the morbid condition For this reason they are distinctly contra indicated, especially in stubborn cases

"Alocol" does not neutralize acid it absorbs the excess colloido chemically and at the same time leaves a sufficiency for normal gastric digestion The outstanding advantage of Alocol ' as an antacid is that it removes from the stomach the excess of the acid radicle (Cl) instead of merely temporarily neutralizing it Alocol" can be used for prolonged periods without the slightest harmful effect

A supply for clinical trial with full descriptive literature sent free on request

M 197

"Alocol" is indicated in all conditions in which diagnosis reveals high gastric acidity It is particularly valuable in the treatment of chronic affections of the stomach, the dyspepsias, especially those of pregnancy gastric and duodenal ulcer, gastrosuccorrhea and in conditions characterized by gastralgia, pyrosis flatulence acid eructation and other symptoms common to gastric disease

INSULIN

STABLE AB UNIFORM

BRAND

PURITY—AB Insulin is manufactured on a very large scale by a greatly improved process under ideal conditions. Based on very thorough and careful investigations the method employed for making AB Brand Insulin ensures the highest attainable degree of purity and freedom from toxic impurities. AB Insulin is constant in its effects does not give rise to inflammation at the site of injection nor produce other untoward symptoms.

STERILITY—The Insulin solution is carefully sterilized and packed under aseptic conditions. The sterility of each batch is ensured by bacteriological examination of samples drawn from the finished stock.

ACTIVITY and Uniformity—Each batch is physiologically tested accurately standardized on the basis of the accepted unit and passed under the authority of the Medical Research Council.

STABILITY—There is ample evidence to show that Insulin AB Brand retains its activity for a considerable length of time even under tropical conditions. Samples drawn from stock sent out to India and returned to London have been found to show no detectable deterioration.

"OSMO" KAOLIN

TRADE MARK

(Morson)

A Pure, Sterile, Colloidal Kaolin

Prepared under Letters Patent by electro osmosis for use in Medicine and Surgery

INTERNAL—"Osmo Kaolin is invaluable in the treatment of intestinal disorders arising from infections by bacteria, the toxins of which it has the power of adsorbing to a marked degree and thus rendering innocuous. It may be employed with great advantage in summer diarrhœa, cholera, dysentery and intestinal toxæmias in general, also in inflamed and ulcerated conditions of the intestinal tract.

EXTERNAL—"Osmo" Kaolin is employed in the preparation of cataplasmata to remove œdema and relieve the pain and swelling of local and deep-seated inflammation. It is also an excellent dry dressing for wounds, owing to its power of adsorbing discharges and thus favouring the processes of repair.

Full particulars and descriptive booklet will be sent post free on request

"Osmo" Kaolin is packed only in boxes containing 3 oz. weight.

EDUCATIONAL NUMBER, SESSION 1924-25

NEW CONCEPTIONS IN THE TEACHING OF PUBLIC HEALTH

BY

ANDREW BALFOUR, C.B., C.M.G., M.D., B.Sc., D.P.H., F.R.C.P.Ed.,

DIRECTOR LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE

THERE has been a cry from Chile, faint and far distant, but not without a certain significance for this country at the present time. It was raised by Dr. Alejandro Del Rio in the course of an address to the University of Chile, wherein he bemoans the state of the public health in that South American republic. It is noteworthy that he cited England as "the cradle of hygiene," and compared the huge sum spent there annually by the State and by municipalities in safeguarding and promoting the health of the populace with the two million pesos—roughly £83,333—which is all that Chile in 1923 was expending for like purposes.

Dr. Del Rio's address is embodied in a paper recently published. He pleads for revised sanitary organization in Chile, for a stirring of bones which, if not dry, are yet tending towards *desiccation*, for a *recognition* of all that hygiene means to a modern community. He acknowledges England as the leader in that great movement which, during the last seventy years, has revolutionized health conditions in many parts of the world, but let it be noted that, in framing his budget, he takes as his basis the American standard of one dollar per person per year for public health work.

While it is to the two great English-speaking countries of the globe that he turns, there is possibly a suggestion that, though he sees in England the fount of hygienic knowledge, he finds, in the application of that knowledge, the United States nowadays leading the way.

Be that as it may, in hygiene, as in other departments of medical *science*, progress, as the distinguished Chilian recalls, depends on education, and the enlightenment of the people can only proceed on sound lines if those who specially profess public health work are afforded full facilities for the study of hygiene in all its branches. Now the hygiene of to-day differs markedly from that of thirty years ago. Indeed, we may go farther and say that even in the last fifteen years, or, for that matter, the last ten years, the outlook in matters hygienic has not only been greatly extended but has actually changed in many directions. Certain aspects of public health have receded, others have come notably to the front, and, in addition, there has been a correlation and co-ordination previously lacking. Our views have widened with increasing knowledge, with increasing responsibilities, and with the increasing pressure which the complications of so-called civilized life impose upon us.

THIRTY YEARS AGO

Thirty years ago the student of public health did very fairly well upon a regimen which included a certain amount of bacteriology, a considerable amount of chemistry, a smattering of physics. Here and there he got a little geology in addition, and, if he was fortunate and had good teachers, he learned something of the application of these sciences to preventive medicine. Some instruction in meteorology was given him, and he was taught in a perfunctory kind of way the elements of building construction. He had to study what were called the general principles of sanitary engineering, a study which certainly did not fit him to discuss intelligently the problems of that science with an engineer. Much time was devoted to disinfection and disinfectants, but the consideration was more theoretical than practical. The microscopical examination of foods was quite a feature of the curriculum, but resolved itself largely into a recognition of starch granules and the method of detecting chicory in samples of coffee. In addition, some time was devoted to rather vague generalities entitled the general pathology of infection, and to a few facts concerned with some diseases of animals transmissible to man. Those of a parasitic *nature* were usually expounded in an erroneous manner.

Having passed the first part of his examination for the D.P.H. he found that Part II. required of him quite an extensive knowledge of sanitary law, which, as a rule, had to be acquired in a parrot-like fashion, a familiarity, usually dreaded, with vital statistics, which, if vital for examination purposes, were shorn of any other vestige of vitality, and a rather thorough acquaintance with abattoirs and common lodging-houses. He was supposed to know something about meat inspection, about nuisances injurious to health, and about insanitary dwellings, with defective water-closets as a prominent feature. The great subject of industrial hygiene was represented by a few lectures on dangerous trades and occupations, which often took the form of discourses on lead poisoning, and finally there was a kind of *olla podrida* consisting of *exercises concerned with season*, climate, and what was called general epidemiology, which rarely proved an inspiriting form of mental pabulum.

THE NEW OUTLOOK

It will be seen that, in large measure, this course of study was overshadowed by the idea that environment was, if not all important, at least the principal factor determining the health or otherwise of the people. This view was sound enough within limits, but of late years we have come to recognize the significance of the *individual*, a new conception has arisen not only as regards the factors influencing health, but with respect to the aims and aspirations of the hygienist. Thirty years ago there was a tendency to divorce State medicine, as it was called, from the medicine taught the medical student and practised by the physician and the surgeon. To-day the eloquent pleading of Sir George Newman for the permeation of the medical curriculum with

the preventive idea has reminded us that the subjects are one and indivisible It is this widening of view, this recognition of the paramount importance of such problems as those presented by maternity and infant welfare, by the safeguarding of the health of the "toddler" and the school child, by the care of the adolescent, by the control of the healthy or unhealthy disease "carrier," by the study of the mentally defective, by the efforts to eliminate the alcoholic and the drug-taker, by the campaign against tuberculosis and venereal disease, by the dental service, by industrial welfare, by the necessity for a sanitary cordon, by the need for combating many so-called minor maladies—it is this new conception that has resulted in the movement to alter the public health curriculum There have also been other determining factors Largely as the result of the progress made in tropical medicine, the great part which parasitology plays in the incidence and spread of disease, both at home and abroad, has been demonstrated, and, as a result, the study of medical biology has attained a prominence formerly denied it The same is true as regards comparative pathology, for every year sees the bonds more closely forged between human and veterinary medicine Again, the principles of immunology are so well established, and the practical results arising from their elucidation are so far-reaching, that any study of bacteriology, and indeed of pathology, using the word in its widest sense, necessitates instruction in both the theory and practice of what thirty years ago was a science in the making The whole outlook as regards food, drink, and dietaries has changed It is the age of vitamins and of deficiency diseases, and here and elsewhere biochemistry has come, or is coming, into its own Our views regarding industrial hygiene have been revolutionized, and we perceive the role which physiology plays in determining the fitness of the worker for his task, the influence of labour upon both his mind and his body, and the duty of the employer and of the State towards the producers, the most important section of the community Considerations of this kind—and many more might easily be cited—led the Athlone Committee, in the report which it issued in 1921, and which dealt with post-graduate medical education, to urge that further facilities should be provided in the instruction in public health Two years before, the General Medical Council had resolved on reform of the D P H regulations, and had dispatched Dr Bruce Low on his famous inspection In 1922 new regulations for the Diploma in Public Health were issued

That some alteration was required will be generally conceded, for, apart from the new outlook to which we have referred, there was a well founded feeling of dissatisfaction with the manner in which training in public health was being conducted As a matter of fact, the old enthusiasm which in the earlier days fired the disciples of the goddess Hygeia and enabled so much to be accomplished had, in some measure, waned, there was a tendency to stereotype the teaching, the interests of the examination bulked too largely, and there were other defects, at least in certain quarters

THE NEW D P H REGULATIONS

Somewhat stringent measures were required, and the decree of the General Medical Council brought them into operation The new regulations for the D P H became operative on January 1st of this year, but their immediate effect, in London at least, was to crowd some of the larger teaching schools with students anxious to enter and qualify under the old regime Thereafter there was a marked diminution in the number of applicants, partly because the new regulations entail the expenditure of more time and money in obtaining the diploma, partly, perhaps, because the stiffening of the examination repelled the faint-hearted, partly because the regulations were in certain instances misunderstood, partly, without any doubt, because it was felt by would-be candidates that the game was not worth the candle—in other words, that the prizes to be gained were not commensurate with the effort demanded, that the remuneration of whole-time medical officers of health was inadequate Another result was to determine certain of the medical schools which had hitherto conducted courses for the D P H to abandon them, so that at the present time the London student can only pursue his studies at four places—namely, University College, King's College, Middlesex Hospital Medical School, and the Royal Institute of Public Health These institutions have made provision, more or less adequately, for giving instruction in accord with the new regulations These last may be briefly considered and the erroneous ideas which prevailed regarding them dispelled, although efforts have already been made in this direction (BRITISH MEDICAL JOURNAL, June 21st, 1924)

Rule 1 provides that a period of not less than two years shall elapse between the attainment by a candidate of a registrable qualification in Medicine, etc, and his admission to the *Final* Examination for a diploma or degree in Sanitary Science, Public Health, or State Medicine The three terms are used because different teaching bodies unfortunately have not adopted uniformity of nomenclature It would be better to drop Sanitary Science and State Medicine in favour of Public Health, at once the most comprehensive and suitable term

Now this rule does not mean, as it has been assumed to mean, that an interval of two years must separate the two parts of the examination in Public Health It means that, from the time when he has qualified himself to be placed on the *Medical Register* as a fully qualified medical man, the public health student must allow two years to run their course before he can proceed to Part II of his Public Health examination This provision is made to give candidates time to review the situation and to gain, either in practice or in hospital or laboratory posts, experience of medical work in a responsible capacity, so that they will be more mature and better able to envisage the situation and direct their energies to good ends when they enter upon public health careers It is the same kind of opportunity which is vouchsafed to those who, after graduating and before commencing practice, are fortunate enough to secure resident hospital appointments Candidates from the dominions in possession of medical qualifications registrable in this country are eligible for the examinations under the same conditions

Rule 2 determines that the curriculum shall extend over not less than twelve calendar months subsequent to the attainment of a registrable qualification Hence only one year's Public Health study in all is required, and while, under Rule 7, no one may proceed to Part II until he has passed all the subjects of Part I, and while, in the case of both parts, he must pass all the specified subjects for each at one time, there is no necessity, as has been supposed, to take the *whole* course of studies prior to appearing for Part I All that is required, as Rule 8 affirms, is that the candidate cannot sit for Part I until he has completed the courses of instruction in the subjects prescribed for that part Rule 9 makes the same provision as regards Part II of the examination

Let us now see what subjects the student has to study and profess We need not here consider the amount of time he has to devote to each, save in two instances, for the information is readily attainable and we are concerned rather with indicating how the new regulations differ in certain important particulars from the old

The following is the full course of study, which, as we have seen, must extend over not less than one year As of yore, bacteriology, chemistry, physics, meteorology, and climatology figure, but, ranked along with bacteriology, stands parasitology—including, be it noted, medical entomology These subjects are to be studied in their relation to the diseases of man and to those diseases of the lower animals which are transmissible to man As formerly, the student has to gain familiarity with the principles of public health and sanitation, with epidemiology and vital statistics, with sanitary law and administration, with sanitary construction and planning The change here will be more in the method of teaching than in the subjects taught, but it is significant that sanitary administration will include the Public Medical Services—for example, all that elaborate organization which has been established of late years under the National Health Insurance Act, and the activities of the Poor Law, Public Health, and School Medical Services

As in the past, attendance at a recognized hospital for infectious diseases is compulsory, and so is a course of practical study under a medical officer of health, but, in the former case, although the total period of attendance is, as before three months, the daily attendances required are specified, which was not previously the case, while, in the latter six months' study instead of three is required. Moreover in addition to public health administration, the candidate must show evidence of having received instruction in maternity and child welfare, health service work for children of school age, venereal diseases service, tuberculosis service, industrial hygiene, and inspection and control of food, including meat and milk. This constitutes a great advance, and if suitable arrangements can be made, should familiarize the student with some comparatively new and most important aspects of public health work.

At Part I the aspirant must satisfy the examiners in what may be called the laboratory subjects, both on their theoretical and practical side, together with meteorology and climatology. The examination is practical, written, and oral.

At Part II the candidate must pass in hygiene and sanitation (including sanitary construction), in epidemiology and infectious diseases, in sanitary law and vital statistics, and in public health administration. The examination is written and oral and includes practical examinations with respect to infectious diseases, foods, and premises of various kinds.

The new regulations have been the subject of considerable criticism. It has been affirmed that they will defeat their own ends, and prophets are not lacking who maintain that they will require revision, if not abrogation. Those best qualified to speak, however, are of opinion that they constitute a distinct and useful step in advance. In this connexion the pronouncement of a distinguished medical officer of health of wide experience, who has been for many years closely associated with public health teaching is of special interest and value. In a paper which appeared in the BRITISH MEDICAL JOURNAL of August 2oth, 1922, Dr Hope of Liverpool expresses his satisfaction with the new regulations, although, as regards one or two points, he thinks they might be made a little more explicit. Much undoubtedly will depend on the success attending the effort to improve the salaries paid to whole-time medical officers of health. The public must realize that if it wants health work it must pay for it, and that, considering the vast developments of recent years, and the increasing burden and responsibilities to which health officers are subjected, these servants of the people who are also guides and counsellors, or as Sawyer, the American, would fain regard them, sanitary statesmen, must receive adequate remuneration. If we are to have skilled and highly trained medical officers of health (and surely no one nowadays will dispute such a desirability), then it is essential that they should receive, not a mere living wage, but a salary commensurate with their attainments and bearing a reasonable relationship to the amount of time and money that has been expended in fitting them for their onerous and all important duties.

To do the people of this country justice they have, as a rule in health matters, risen to the occasion and though in former days fear, discomfort, and, in the case of employers of labour, the pinch of the pocket, were the chief factors in determining the tension of the purse strings, to-day a new spirit is abroad. True it is neither so robust nor so widespread as could be desired. Familiarity with health has in certain quarters bred contempt of health measures, or, to put it another way, unfamiliarity with epidemics has led to forgetfulness of how such immunity was purchased, and how alone it can be maintained. Still at heart we are a sensible, if not always a logical people, and there can be little doubt that those who really count appreciate the medical officer of health at his proper value, and will not be indisposed to see him receive the monetary recognition he deserves, especially when they understand how much is now expected of him, how infinitely greater is the scope of his duties, and how dependent they are on his expert knowledge.

There is, therefore, reason to hope that ere long there will be an improved economic outlook for the public medical services and that consequently it will be unnecessary *materially*, to modify the new regulations for public health diplomas and degree. As has been said, the Athlone Committee duly recognized the necessity for a radical change in the post-graduate teaching of public health, but it also recognized that this country, impoverished by the war and burdened by heavy taxation, was not in a position to make adequate provision for the desired reorganization.

THE ROCKEFELLER BENEFACTION

Happily the Rockefeller Foundation, which had already done so much for humanity, which had aided so many of our colonies in the struggle against the hookworm, and which had enabled certain aspirations for improvement in medical teaching in this country to be realized, came to the rescue. It offered the sum of two million dollars for the purpose of purchasing a site in London, and erecting thereon and equipping in an up-to-date manner a school for instruction in hygiene, similar to those schools at Harvard and Baltimore which its munificence had already brought into being, and which had already embarked upon their careers of usefulness. This great and generous gift was made with the proviso that the British Treasury should provide funds for the upkeep of the school, such funds to be paid through the Ministry of Health. The Rockefeller Foundation as a rule proceeds upon such lines, the wisdom of which is enshrined in the old saying, "God helps those who help themselves."

The gift and its terms were accepted, and measures were taken to give effect to the decision. As it would take time before the necessary buildings could be erected, the Foundation went even farther, and provided an annual sum of money to enable a start to be made with the preliminary organization required. It was decided that when the institute was built it should become a recognized school of the University of London. A special committee secured a suitable site in Gower Street, framed provisional plans, and drew up a provisional course of studies. Then the conduct of affairs passed into the hands of a Transitional Executive Committee, and this body amongst other things, arranged that the existing London School of Tropical Medicine should become an integral part of the new School of Hygiene. It was desired that the work of the school should be of an imperial, and indeed of an international, nature. Year by year the hygiene of the tropics approximates more closely to that of the homeland. There is no dividing line. The principles governing both are the same even if the practice of hygiene in the tropics differs, and will continue to differ in many respects from that of lands with temperate or cold climates.

Moreover, tropical medicine, although a special subject requiring special study, should not be, indeed cannot be, wholly divorced from the medicine taught at our medical schools. There are few diseases which are entirely limited to the tropics, while the role of medical biology, at first apparently more or less confined to maladies of hot countries, has now been found to extend to many diseases which have no special connexion with the torrid zone.

It was felt that a great opportunity had arisen for linking the homeland with its overseas possessions, so far as the conquest of disease was concerned, and for establishing a centre of light and learning, a Mecca to which the devout students of medicine and hygiene might resort, not only with a view to acquire knowledge but to conduct research and to gain opportunities of discussing their problems and their perplexities.

The Transitional Executive Committee paved the way, and in the fullness of time relinquished its duties to a board of management, some members of which were appointed directly by the Ministry of Health, while some were representatives of the large Court of Governors which had been established, and to which the board will report annually upon the work and progress of the institution.

PLANS FOR THE SCHOOL OF HYGIENE AND TROPICAL MEDICINE

The provisional scheme of lectures and practical work to which we have referred has been framed on broad lines and with due regard to the new regulations for the D P H

In certain respects it may require modification, either in the way of curtailment or of extension, but in all probability the six main divisions will hold good These are as follows (1) Applied Physics, Physiology, and the Principles of Hygiene, (2) Chemistry and Biochemistry, (3) Immunology and Bacteriology, (4) Medical Zoology, Parasitology, and Comparative Pathology, (5) Epidemiology and Statistics, (6) The Principles and Practice of Preventive Medicine, General Sanitation, and Administration In addition there will be theoretical and clinical instruction in tropical medicine—the bedside teaching, thanks to the continued courtesy and interest of the Seamen's Hospital Society, being carried on for the present, as heretofore, at the Hospital for Tropical Diseases in Endsleigh Gardens It is hoped also to extend very considerably the altogether inadequate instruction now given in tropical hygiene

In connexion with each of the divisions there will be special courses, and the instruction, as far as possible, will be of a practical nature Thus, to take but one example, the science of vital statistics will be taught not so much in the classroom as in the laboratory Its principles will be applied to actual problems in epidemiology, and the student will be made familiar with the methods employed by statisticians, and will himself make use of these methods No better exposition of the system required could be given than that set forth by Dr Hope, but the reader's attention is directed also to an article in the BRITISH MEDICAL JOURNAL of April 7th, 1923 (p 600)

Every branch of public health work will receive attention, but naturally greater stress will be laid on some subjects than on others In the past, public health chemistry would appear to have bulked unduly in the training of the student It must be recognized that it is a mere waste of time and money to try and produce chemical pundits, they are not required in the public health services What is needed is that a medical officer of health should be well grounded in the principles underlying public health chemistry and should be able to evaluate intelligently an analyst's report on water, food, or sewage It is, for example, very much more important that he should spend time, formerly devoted to making minute chemical examinations of foodstuffs, to the study of those biochemical developments as regards dietaries which have so large a bearing on the health of communities Instead of spending hours analysing a sewage effluent he should be taught to grasp the significance of the bio-aeration of sewage, and the factors involved in the various processes of purification Instead of searching for metals in a water he should concentrate on such a question as chlorination, and be made to understand the paramount importance of a survey of a watershed or gathering ground

In his training with a medical officer of health he should be given an opportunity of seeing something both of urban and rural conditions, and when he is taught the problem of industrial hygiene he should see for himself the conditions obtaining in the factory and the workshop When he comes to apply his bacteriology to immunology he should gain at first hand a familiarity with the practical outcome of immunological studies, with the production of vaccines and serums on the large scale, and so, in every department, the inculcation of precepts should be supplemented by the visual lessons of practice Still more important is it that the teachers should realize what is required of them, and should bear in mind a statement made regarding the school to this effect "We do not wish to see either a mere machine for enabling youths to pass certain examinations or a temple of esoteric study and academic research"

PROVISION FOR RESEARCH

Research, of course, there should be, there will be Research is as the breath of life to any teaching institution It quickens and refines it, but research in a school of this kind must be devoted very largely to practical ends Think what might be achieved by co-operation between the bacteriologist, the chemist, and the sanitary engineer! At present these three worthy classes of inquirers tend to work in watertight compartments

If anything were required to show the need of research on public health problems it is the humiliating reflection that in no single instance has the causative organism of any one of the common communicable diseases *in this country* been discovered by a British worker Take typhoid, take cerebro-spinal fever, take tuberculosis, take diphtheria, take syphilis, take any of the others, and the same sad tale has to be told Surely there is something wrong here—something that might be, and should be, remedied, for that men of our race possess the ability to make such discoveries is shown by their triumphs in the tropical field

It may be that our medical officers of health who handle much of the material are not given opportunities for study and research It is hoped at the new school to provide them with "refresher" courses, and to make arrangements which will permit them to attend such courses Here it is that a great graphic museum of hygiene might play a notable part, just as it might also serve the needs of the populace at large, and just as its section on tropical medicine would come as a boon and a blessing to the student from our colonies and dependencies The part played by the medical museum as a teaching force has never been fully exploited in this country, but a glance at the Tropical Health Section at Wembley will give some idea of its possibilities There are many other points which might be mentioned, but we have wellnigh exceeded the limits of our space

THE IMMEDIATE FUTURE

Whether or not the school can embark on any part of its curriculum before the building is erected is a question not yet settled It would assuredly seem that, in several directions, a start might well be made, especially as a promise of certain facilities has kindly been extended to it There are some subjects in the proposed curriculum for which, at present, proper provision does not exist, and it would appear both justifiable and advisable to establish courses for them At the same time it must be remembered that the Treasury grant cannot be claimed until the building has been completed and is ready for occupation, so that there may be difficulties in the way of financing any such project

The same is true as regards the extension of the course in tropical hygiene to which reference has been made, and lack of funds may also militate against any scheme for encouraging instruction in biochemistry in the Division of Tropical Medicine and Hygiene, as the London School of Tropical Medicine became on August 1st, 1924

All these questions are receiving careful consideration When the building is ready, say two years hence, and the school is prepared to undertake its task of post-graduate teaching in public health in all its branches, there is every probability that all such teaching in London will be concentrated within its walls Until that time the requirements of public health students will be met at one or other of the institutions above mentioned, while the teaching of tropical medicine and hygiene will continue, together with research work on these subjects, at 23, Endsleigh Gardens At the same time it should be noted that a special course of lectures on sanitary law and sanitary administration will be available at St Bartholomew's Hospital Medical School

For the present there will be no alteration in the short twelve weeks' course for the certificate in tropical medicine and hygiene, and for the D T M and H It is, however, fully recognized that such a course has become quite inadequate Tropical medicine has grown by leaps and bounds, and it is hopeless to try and cram all that should be known about it into the period which sufficed when Sir Patrick Manson was laying the foundations for the study of the subject, which owes to him, more than to any other man, its present position and importance

It is hoped, therefore, to institute two five month courses in the academic year, but naturally there are many points requiring careful consideration before such a radical change can be made Within limits *festina lente* is a good motto, as is the kindred and more vulgar saying, "Haste is begotten of the devil"

Not long ago a witty after-dinner speaker contended that the function of the new school was to make this country "a fit place for Americans to live in" He was but joking, yet there is more than a grain of truth in the remark Americans visiting England, and more especially London,

are with good reason shocked at the way our foodstuffs are transported and handled They also find other causes for criticism, though happily there is much they can admire, and even perhaps a little they might copy, more especially in the way of administration Yet only the other day, in Liverpool, a distinguished American hygienist commented unfavourably, and it is to be feared justly, on the appearance of a crowd congregated in the streets of that great city He saw there signs of destitution and drink, which it would not have been easy to match in any similar gathering in the United States Here is evidence of failure and food for thought

The students of the school must be so trained and guided that they will acquire the wider outlook They must be versed in the elements of sociology they must become apostles of the doctrine of co-ordination and consolidation of social effort in all its ramifications, and there must be impressed upon them the significance of what has been called the "anticipatory work" of the epidemiologist It will be well if they and their preceptors bear constantly in mind the truth of Hermann Biggs's dictum which Dr Sprott of Tasmania recently quoted to such good effect 'To make the unfit fit is a noble task, but to make the fit fitter is a larger and higher achievement"

OPHTHALMIC PRACTICE

BY

N BISHOP HARMAN, M A, M B CANTAB, F R C S ENG,

SENIOR OPHTHALMIC SURGEON WEST LONDON HOSPITAL LECTURER IN OPHTHALMOLOGY (LATE DEAN) WEST LONDON POST GRADUATE COLLEGE

THE Educational Number of the BRITISH MEDICAL JOURNAL is, for the most part, of interest to prospective medical students, or their parents, guardians, or teachers For these the store of information furnished therein regarding medical schools, medical degrees, and medical appointments is as the map that guides the stranger who essays an entry into a new land To these this article on ophthalmic practice will make small appeal It is written mainly for those who have already explored the land in some directions and staked out some claim to prospect therein To two sets of men these observations upon ophthalmic work may be of value first, to the man who proposes to take up ophthalmology as his life work as an ophthalmic surgeon and secondly, to the man who proposes to enter general practice, or may even now be in general practice, and who desires at the same time to make himself proficient in some special branch of medicine and surgery, and whose inclination turns towards eye work For both of these types of men there is a steadily increasing field for work, and the work itself is particularly fascinating and satisfying

THE FIELD FOR WORK

Within the last score of years the demand for qualified practitioners competent to deal with ophthalmic work has increased greatly The first great move promoting this demand was brought about by the establishment of the medical inspection of school children Indeed, it may be said with much truth that it was the work of ophthalmic surgeons amongst school children that created the demand for the medical inspection and treatment of school children Now little more than twenty years since the inauguration of this work, there are throughout the country medical men and women habitually investigating the problems of errors of refraction and diseases of the eye, and doing this work in a fashion that is a credit to themselves and the service to which they are attached, and to real advantage to the school children who are their patients There is a repercussion from this systematic work amongst school children upon the general public Parents are learning that what they thought good enough for themselves is now good enough for their children The casual choice of glasses from the counter of any spectacle vendor or the more mystifying supply of glasses from a prescribing optician the parents now know is not good enough for their children, and they are beginning to wonder if these casual methods are good enough for themselves Hence there arising a steadily increasing demand for the provision of an ophthalmic benefit for the million and through it the possibility of obtaining the service of medical practitioners competent in ophthalmic work when need arises The demand is based upon the ever increasing complexity and strain of a highly organized civilization Statutory authorities, shipping and railway controllers, manufacturers and other employers, are bound to select fit persons for their particular work, and eye fitness is a primary necessity Workers in every walk of life, teachers, scriveners artisans, seamstresses, and mothers, each in turn feel the need to remove a possible handicap arising from defective eyesight, or from conditions of sight ill adapted to the work in hand The intimate relation of the conditions of the eyes to general bodily health and disease makes it inevitable that this demand can only be satisfied by the provision of fully qualified medical practitioners Any lesser provision would prove an expensive substitute in the long run There are the new fields for eye work now being added to the existing forms of ophthalmic practice, and they may ultimately prove to be the wider fields

THE WORK

There is perhaps no form of practice furnishing such a variety of experience as eye work, and it is certain there is no happier field of work for those whose minds desire something like completeness in their work The examination of each eye patient is a voyage of discovery The sorting methods of the receiving room of an out-patient department of a hospital have no place with eye patients The wiser the doctor the less inclined is he to satisfy the dramatic instinct for a "lightning diagnosis" based upon the patient's statement of complaint He learns to value scientific methods and to use them But scientific methods of inquiry alone will not satisfy, they must lead to something, and in eye conditions we have this requirement, for there is so large a mastery over means that the end is obtained with a frequency and a completeness that is a source of gratification to both patient and doctor

THE YOUNG GRADUATE

The young graduate in medicine may well take stock of his equipment He has worked diligently during the years of his novitiate, passed his qualifying examination with credit, and perhaps held a house appointment at his hospital During these six years he will have learned something of the anatomy and physiology of the eyes, and of their neural and vascular connexions he will have attended the eye clinic for the prescribed period and a few lectures and demonstrations on the diseases of the eyes He will have learned that a 'pink eye' may be due to conjunctivitis, an iritis or a glaucoma and possibly be able to give a fair account of the means whereby the necessary distinction is to be made in any given case But in the absence of that assurance born of habit he knows that the next time he sees a red eye facing him he will feel hopelessly confused by the minuteness of the symptoms, even though he has been assured that they are writ large for him to read with his own eyes He knows what an ophthalmoscope is, and has made a valorous effort to master that "open sesame" to vascular and cerebral conditions Indeed once he got such a view into the interior of an eye that he ventured to pronounce (with some hint of reservation) that the eye was normal for which daring he received high commendation from his preceptor in that he had recognized a "normal fundus oculi" But alas! three weeks later on his return from a jolly holiday he found he had forgotten the magic words, and by no means could he peep again through that chink in the human anatomy which revealed such wonders The memory annoys him now, and it is aggravated by the recollection of the assurance of the eye surgeon, who, when called into the wards by his neurologist or physician

colleagues to examine a hard case for them, saw things and wrote them down as definite statements of fact that had the determining influence in clearing up the knotty diagnosis Or he remembers another case of obscure headache or of wry-neck which had baffled physician and surgeon, and which the ophthalmic surgeon claimed as his own proper case, for the symptoms were due, he said, to an undetected defect of muscle balance, a hyperphoria, or latent vertical squint, which being corrected by glasses gave the patient immediate and permanent relief These and other such cases are impressed upon his mind, and he feels a very proper greed for the mastery of that power for himself He cannot buy it, he must win it And now, just as he is going out from the house of learning after half a dozen years he wonders how he is to get it

First let me sketch out a course of work for the would-be ophthalmologist, and next indicate the manner in which the general practitioner may render himself reasonably competent in eye work

THE YOUNG OPHTHALMOLOGIST

The young ophthalmologist has before him a strenuous course of preparation, one which will absorb some three years before he can expect to be able to settle himself in the practice of his specialty and hope to obtain the suffrages of the practitioners of his chosen area of work He must be so well reported of to them as to secure their initial attention, and so well equipped for his work as to be able to retain and increase what he obtains by report

He will need to attach himself to an eye hospital of good standing, where there is plenty of work and a good teaching staff, or, failing that, to the eye department of a large general hospital, again preferably a teaching hospital His former teachers will furnish him with introductions to the school and possibly to some member of the staff There he will learn the everyday practice of his chosen work He will find ample, often superabundant, clinical material for investigation But unless he is content to become little more than a rule-of-thumb worker, a mere copyist of other men's methods (and a poor copyist, since he may not know the sources of their inspiration), he will not be content with absorption in clinical work He will take out a course in optics, wrestle with the complexities of mathematical and applied optics, he will proceed to learn how lenses are made, and even to know something of the making of the instruments he uses and the spectacles he proposes to order He will take out courses on the physiology of the eye, become familiar with the intricacies of muscles and muscle movements, and also in neurology, and learn to think in nerve paths, so that at least he will be able to meet the neurologist in his own house If time allows he will work at a nerve hospital and perhaps hold a house office there He will make friends with the clinical pathologist and carry off from him as much as he is able to bear At his chosen eye hospital there will be work in the bacteriological laboratory, and he should constitute himself liaison officer between the clinician and bacteriologist, so as to see both ends of the lines of communication and be able to judge of their significance Again, he will work in the pathological laboratory and learn the technique of the preparation and examination of excised eyes and pathological material In all these things he should strive to put himself in such a position of practical knowledge that he could if needs be do the work himself, for it may be that his lot will be cast in a place where a multiplicity of skilled workers is not available, so that if he is to continue in scientific methods or carry out research for himself he must have the assured knowledge that will enable him to set others to work

As a corrective to this intensive study of disease he will do well to get out into the world and see what the average man, woman, and child is like Let him make friends with the school medical officer, visit the schools, do some of the medical inspection himself, go to the clinics and take a hand in the work, let him visit the several types of special schools—for the blind, the myopes, for the sufferers from contagious eye diseases, for the deaf, the cripple, the mentally defective—and the open-air schools for the weakly, and let him observe the special features of each Let him go round with the factory surgeon and see the inside of the works whence come the injured eyes Let him by hook or by crook see the inside of every sort and condition of human activity where work and lighting are likely to have any effect upon the eyes Lastly, his holidays must be wholly devoted to the exploration of new fields of eye work, to visits abroad to Continental and, if possible, American clinics, so that his mind may receive the enlargement of other men's methods

During all this period he will read assiduously, first from advanced textbooks and then from original papers, and gradually he will find that some one or other branch of the work will seize upon his imagination, so that his daytime clinical and practical work will be turned to special account in the investigation of some problem, and he will find himself a research worker Examinations will need to be considered, and these should be got over early as a necessary evil He will need the Fellowship of the College of Surgeons of the chosen area of his work, or if he proposes to work in the dominions one or other of these Fellowships or a diploma in ophthalmology will serve his turn He will have served as clinical assistant or chief clinical assistant or as a house officer in the eye hospital or department, and these also will serve as vouchers to his credit when he seeks to obtain a hospital appointment

THE GENERAL PRACTITIONER AND EYE WORK

The programme of the general practitioner who wishes to secure a reasonable competence in eye work will be much less ambitious He can give but months where the other man must give years But if he is intent upon his effort and is prepared to make the necessary sacrifice of his leisure and of some of his general practice, he can secure his end, for others have done it before him He will be wise, at any rate at first, to confine his effort to a mastery of the diagnosis and treatment of the ordinary disorders and diseases of the eye For his purpose he must become thoroughly familiar with the use of illumination, corneal loupes, and retinoscopy mirror, and the ophthalmoscope A real working knowledge of these instruments based upon his prolonged training in general medicine will make him a reasonably competent worker in ophthalmology, who may be trusted to carry on the work of a school clinic and investigate and treat the ordinary run of private eye cases These limitations need not bound his vision, for I have known men in general practice who were able to diagnose accurately a complicated defect of muscle balance

The man in general practice should, if he could, get a clear three months' course at an eye hospital or post-graduate college where "refresher courses" are provided If he cannot do that he should attach himself to the eye clinic nearest his home, and arrange to attend there regularly at definite hours It may be he can only find a school clinic near enough, but that will do If he can show the worker in the clinic that he is in earnest, that he will attend on the stated days and regularly—no matter at what cost to himself—he will find that the doctor in charge of the clinic will welcome him as a colleague and show him all the treasures of his clinic, but for the casual dropper-in no one will have any use, or count him other than a hindrance to work—a nuisance

Work of this order to be effective should be carried out on a system, combining practice with reading It is well to confine the work at the clinic at each visit to the working out of one case only A patient of intelligence should be chosen, and every mode of examination known to the worker carried through methodically Every step should be recorded in his private case-book, and each difficulty experienced and fact observed noted therein At the close of the work his experienced colleague will go over this record with him, and later at his home he will compare his observations with the statements of his textbooks If he will work in this slow and methodical way he will make steady advances in the mastery of his work, and, better still, he will know the reason for what he is doing It is only through such a process of observation and thought that he can arrive at that maturity of judgement which knows how to apply the ascertained fact to the life and habits of each patient, and so achieve the treatment of the patient and not of mere symptoms

The Profession of Medicine.

INTRODUCTORY

For long past it has been our custom to publish a special Educational Number of the BRITISH MEDICAL JOURNAL at this time of year, shortly before the opening of the winter session at the medical schools. The remarks that follow, on the profession of medicine, are addressed more particularly to intending students and their parents. While it would be out of place to discuss medical politics here, the occasion may be taken to touch on a few current matters affecting professional study and practice. Our object in doing so is to put certain considerations before those who think of devoting themselves to medicine, and thus help them to judge of their fitness for the profession and of the prospects it holds out, for there is no walk of life in which a special vocation is more necessary, and few about which so many misconceptions linger in the public mind.

The Educational Number is largely a guide to the steps that must be taken in order to become a *legally* qualified practitioner. With the passage of years the form and contents of this issue have undergone more or less change, but its primary object remains unaltered. It contains also certain sections intended for younger members of the profession who may be in doubt as to the path in medicine they should choose as a career, and a section on the existing opportunities for post-graduate medical study in Great Britain. The particulars given under these two main heads are founded for the most part on official information, and are arranged along the customary lines. We publish also in this issue an introductory article by Dr ANDREW BALFOUR on new conceptions in the teaching of preventive medicine, in which he discusses the new regulations for the Diploma in Public Health, and indicates some of his hopes for the future of the London School of Hygiene and Tropical Medicine, of which he has been appointed the first Director. Dr Balfour's article is followed by a note, written at our request by Mr BISHOP HARMAN, on the teaching and practice of ophthalmology.

Apart from these and other special articles, the prospective student will find in subsequent pages an account of the course of education required of him, the places where this training can be obtained, and the universities and other licensing bodies which test the knowledge gained and issue degrees or diplomas entitling successful candidates to become registered medical practitioners. Here we may draw attention to the need, which increases with the advance of scientific medicine, for a thorough grounding in the fundamentals of science. As Sir Ernest Rutherford said four years ago to the Section of Medical Education at the Cambridge Annual Meeting of the British Medical Association: "In order to maintain and raise the standard of the profession, the medical teaching must be reared on a sound basis of scientific principle. Without that, the energy and enthusiasm of medical teachers is largely wasted."

PORTALS OF THE PROFESSION

Perusal of the articles in this issue will give the idea that there is an almost bewildering number and variety of portals through which admission may be obtained to the *Medical Register*[1]. Nevertheless, although there is no single State examination in medicine in this country, the medical courses of the various universities and schools in Great Britain and Ireland run on parallel lines, and the obligatory curriculum is much the same in all. Within these broad lines, however, there are many differences between the requirements of the individual teaching and examining bodies. The choice should therefore be made early, so that a definite plan may be followed throughout the years of study. To prevent a false step at the outset the student and his advisers should try to obtain a clear idea of the object to be aimed at, or the relative advantages or taking one or other of the degrees or diplomas open to him, and of the comparative difficulties they present.

All who wish to enter the medical profession must comply with certain conditions. These are prescribed by the General Medical Council, which is a statutory body established under the Medical Acts, a statement of its requirements is given at page 403. Many changes have lately been made in the medical curriculum, and this section should be studied with care. Every medical student, after passing examinations in the subjects of general education and in the preliminary sciences, must take a course of training at a recognized medical school, covering at least a period of five years, but usually extended to six years or more. The examination of candidates as to their fitness to practise medicine, surgery, and obstetrics is left to the licensing bodies, which are of two kinds—the universities, and certain corporations in England, Scotland, and Ireland. One of the functions of the General Medical Council is to make sure that the tests at each stage do not fall below a certain standard, and that the students examined have undergone prescribed courses of instruction at recognized institutions. Successful candidates at such examinations eventually receive from the body holding them either degrees, in the case of a university, or diplomas or licences, in the case of a corporation, these qualifications entitle them to claim insertion of their names in the *Medical Register* kept by the General Medical Council. Holders of diplomas and licences once made up the great majority of all medical men, especially in England and Wales. But universities have greatly multiplied, and so many practitioners are now graduates that a student of ordinary ability will be well advised to aim at a medical degree, though it may be desirable to take also a diploma or licence.

COST OF MEDICAL EDUCATION

The question, What does a medical training cost? cannot be answered in a single precise statement, because the outlay varies within wide limits. Besides differences in the charges made by medical schools for instruction there are differences in examination fees as well as in the fees for certificates of qualification, and those who aspire to the higher degrees and diplomas must expect to pay more for the additional courses and tests and certificates. Again, not all students, however industrious, pass examinations with equal facility, and every setback due to failure in the examination room or to illness means added expense. Since professional education must in any case continue for five years at least (a period exceeded by the vast majority), and since the cost of living in different parts of the country varies much, while personal expenditure varies still more, it can only be said in a general way that all those who hope for entering the profession should reckon on an outlay—first and last—of at least £1 500. On the other hand, the number of scholarships and prizes now offered is larger than in the past, in the Scottish universities bursaries are numerous, and the Carnegie Trust (whose regulations are summarized at page 414) gives financial assistance to many Scottish students. The main thing to bear in mind is that, as compared with other professions, the period of training in medicine is long, and for most students costly. There is also to be remembered the time of waiting after qualification when income is apt to lag behind expenditure.

[1] The *Medical Register* is the official statutory list of qualified medical practitioners kept by the General Medical Council.

THE NUMBERS OF MEDICAL STUDENTS

One effect of the war and of after-war circumstances was a great increase in the number of medical students, both men and women, but especially women. The reasons for this increase are suggested in a paragraph in the report[1] lately submitted to the Treasury by the University Grants Committee:

"It would have been strange if a long and devastating war under modern conditions had failed to swell the ranks of the medical students. The unprecedented demands made upon the medical profession—and triumphantly met—for the alleviation and cure of the sufferings of the fighting forces, the revelation through the examination of recruits of an unsuspected amount of physical disability among the civil population, and the losses which the medical profession itself experienced in the field, all no doubt served to draw young men and women to the Medical Schools and Departments."

The following brief survey of the position should be read in conjunction with the note on page 403 on the numbers of registered practitioners. In the thirteen years before the war the annual entry of medical students in Great Britain and Ireland averaged about 1,400, during the war period, although many students left to serve with the forces, the whole number actually studying in the schools was growing steadily larger. In 1914 the entries rose to 1,600, and in 1915 to 1,918, in 1916 they fell to 1,875, in 1917 they rose again to 2,150, in 1918 to 2,253, and in the following year, when demobilization was in active progress, as many as 3,420 new students were registered. After 1919 the number of entries rapidly fell. In 1920 there were 2,531 registrations of new students, in 1921 there were 1,808, and in 1922 there were 1,833. In 1923 a very considerable drop occurred, which led to some misunderstanding, but Sir Donald MacAlister, in his last presidential address to the General Medical Council, has explained the situation. The smallness of the number of students registered last year—545 in all—he attributes to the fact that under the new regulations of the Council a student must now postpone his registration until, in addition to his examination in general education, he has also passed a recognized examination in elementary chemistry and physics. The figures for 1924 will, without question, be considerably higher, and will represent more truly the actual numbers who are undergoing professional instruction for medical qualifications. The great increase in the number of students during the war and after the armistice threw a heavy strain on the teaching resources of the medical schools and colleges. This period of strain is now practically at an end. "In the comparative calm which now prevails the teaching institutions will have leisure to introduce the improvements in the medical curriculum which, with their assistance, the Council has laid down as necessary or desirable at the present time." The recent fall in students' registration is to be welcomed for another reason. Excessive entries of students lead to overstocking of the profession. In 1921 and 1922 the numbers of new practitioners registered greatly exceeded the figure of 1,200 so which was the average before the war, and last year the medical registrations were no fewer than 2,482. These recent large increases have brought the total number of names in the *Medical Register* up to 48,410, and the ratio of qualified medical practitioners to population is now greater than at any previous time. The new regulations, which came into force at the beginning of last year, should do something to keep the entries of students—and, as a consequence, the numbers of the profession—within manageable bounds.

CHOICE OF A CAREER IN MEDICINE

The student, having passed all his tests and placed his name on the *Medical Register*, becomes a member of the profession and assumes the privileges and responsibilities that go with legal qualification. But the final examination, though a great event, is only the opening of a door into a wider field of training and experience. Education must continue throughout his career: a good doctor remains always a student. As Sir Arthur Keith said the other day, "No medical man is honest who is not familiar with what is happening in the best medical circles in the way of discovery and advance in medicine." As an introduction to practice nothing is so useful to the newly qualified man or woman as a year or more spent in junior hospital appointments, and all who can afford the time should look upon the holding of such posts as a most valuable investment. Next comes the choice of a career in the larger world of medicine. Many paths are now open—for example, general practice, Government service at home or abroad, and special work in public health and mental disorder, in scientific research, or in one of the many modern subdivisions of medicine and surgery. Most of these careers are discussed in some detail in the later sections of this number, but a few words may be said here about general practice and the work of a consultant or specialist. A good deal of information on these and other cognate matters will be found in the *Handbook for Recently Qualified Medical Practitioners*, published by the British Medical Association[2].

GENERAL PRACTICE

General practice is still the goal of the great majority of all medical students. The life is onerous and exacting. It has been said with much truth that of all professional men the general practitioner is the worst paid and the hardest worked. Nevertheless, general practice has its compensations, and, for one reason or another, it appeals to many of the very best students. Thus it comes about that this country continues to produce the finest body of general practitioners in the world.

This career is usually entered upon in one of three ways. The newcomer may take a house and wait for patients to seek his services, he may purchase the goodwill of a practice rendered vacant by retirement or death, or—perhaps best of all—he may become a partner in an established practice. A well managed multiple partnership has obvious advantages over single-handed practice, for instance, it allows each partner leisure for recreation and for keeping up with the progress of medical art and science. Success in the work of a private practitioner demands a great deal of knowledge other than that gained at the medical schools, and consequently a man is more likely to be accepted as a partner, or to do well on his own account, if he has already some experience of family practice as an assistant or deputy. A large proportion of general practitioners, therefore, begin their work as assistants.

An all-round knowledge of practical medicine, surgery, and obstetrics should, if possible, be supplemented by skill in some particular branch of practice. Moreover (as already indicated) the value to a general practitioner of having held one or more resident hospital posts is incalculable. In after-life (we quote the words of a great surgeon and teacher) one can generally pick out those who have been thus trained, as they gain a confidence and reliance and experience which they cannot easily obtain elsewhere. Before leaving this subject it ought to be added that the strain of busy general practice is so heavy and often so continuous that only those of sound physique can hope to last the course.

CONSULTANTS AND SPECIALISTS

For those who aim at becoming consultants or specialists, success will depend in the long run not only upon mental gifts and capacity for hard work, but (as is true of practitioners of all branches) on the possession of those qualities which inspire confidence both in patients and in colleagues. In practice, personal tact and character are as important as scientific equipment. Moreover, since the consultant or the specialist can scarcely hope at first to pay his way by consulting work or by the exercise of his specialty, he must either have the means to support himself for an uncertain period or be prepared by teaching or in other ways to defray expenses. A successful physician, surgeon, or specialist is made, not born, and the process of making himself is not remunerative.

The question of additional degrees and diplomas is of special moment to those whose ideas turn in this direction, if only because these are important factors in securing election to the visiting staff of a hospital. Beyond the qualifications, such as Bachelor or Licentiate, which admit to the *Medical Register*, most of the licensing bodies bestow higher titles, such as Doctor, Master, or Fellow, after further tests. For the career of a consulting physician the M.D. degree of a university is usually necessary, and also the Membership of one of the three Royal Colleges of Physicians, according to the part of the British Isles in which practice is contemplated. In the same way, the Fellowship of one of the three Royal Colleges of Surgeons should be sought by those proposing to devote themselves to surgery. There are also diplomas in a growing number of special branches of work, such as public health, tropical medicine, ophthalmology, radiology, and psychological medicine, which are superfluous for most practitioners, but either useful or indispensable for the medical man or woman who wishes to specialize in these subjects. Information about the several diplomas will be found elsewhere in this issue. For all consultants and specialists ample occasions for exchanging ideas and information with their fellow workers are most necessary. Such opportunities are provided by the various medical societies, by the scientific sections of the British Medical Association's Annual Meetings, and by the medical journals, both general and special.

FINANCIAL AND SOCIAL CONSIDERATIONS

It has never been easy to assess the attractions of medicine as a means of livelihood, and at the present moment this would perhaps be more difficult than ever. On the financial aspect of our profession two or three general observations only need be made. Medicine is not to be regarded as a path to fortune, and anyone who enters it with the sole idea of making money has mistaken his calling. The competent practitioner can always make a living, but the main reward of the medical life is the knowledge of good work well done. Whatever the branch of medical work chosen, there are few doctors who become what a business man would consider even moderately rich by the practice of their profession.

But if medical practice, from the financial point of view, offers to the majority little more than a means of livelihood, in its social and intellectual aspects the prospect is brighter. The culture which once belonged to the physician alone, entitling him to his place among members of the learned professions, has spread, and is spreading further, into all ranks of the practitioners of medicine. The great improvement in the education, general as well as technical, of the practitioner has added much to his influence in public life, and has been a large factor in raising his social status during the sixty-five years that have passed since the General Medical Council was constituted under the Medical Act of 1858. A family doctor of the kind that is well styled "the backbone of the profession" occupies an excellent position among his neighbours, and is the friend and confidant as well as the medical adviser of many of his patients.

PRIVATE PRACTICE: THE OUTLOOK

The prospects held out by the various public medical services are indicated in later sections. Here may be noted very briefly some circumstances of to-day that have a bearing on private practice. In the first place, efforts are being made to bring professional training more into line with the growth and differentiation of medical science, and so to raise the level of medical practice, it was with this in view that the student's curriculum was lately recast. Next, the fundamental importance of the work done by the general practitioner is better understood, and it is more fully recognized that an efficient medical service for the community must be based upon the individual skill and devotion of the family medical attendant, working in close touch with the aims and methods of preventive medicine. The private practitioners of to-day are taking a wider view of their duties towards the environment and the habits of their patients. On the other hand, increasing contact with public duties makes new demands on the practitioner. The multiplication of official requirements and time-some administrative details has a tendency to cramp his independence of action, and there are those who see in the "officialization of medicine" the gradual undermining of professional freedom.

The National Insurance system, now more than twelve years old, has already had a profound influence upon the private practitioner and his work, so much so that it needs some little effort to recall clearly the conditions of industrial practice before the year 1913 both as affecting the medical profession and the large section of the community which became insured under the Act of 1911. The Insurance Medical Service now comprises nearly 14,000 practitioners, some doing much work among insured persons, others little. If the freedom of family practice and the robust individualism of the private practitioner have been restricted by the Insurance Acts and Regulations, there is a general belief that the panel system has provided a better service than existed under the old "club" arrangements, though it is by no means as complete or as effective as it might be made. Whether the remuneration is adequate to the services required may well be doubted, but it is easier now for a doctor to make an assured income out of attendance on working-class patients.

The full effect of the insurance scheme upon the medical profession as a whole, and upon the private practitioner as an individual, is as difficult to gauge as its effect upon the public health. Some of its most objectionable features have been removed through the efforts of the Insurance Acts Committee of the British Medical Association, which is the central executive of the Local Medical and Panel Committees of the country, and represents, with conspicuous success, the interests of insurance practitioners in all negotiations with the Government. The question is often asked: Has the National Health Insurance system justified its existence? If we may judge from the interesting discussion held in the Section of Medical Sociology during the recent Annual Meeting at Bradford, the answer of the medical profession at large, and of the other interests concerned, is an unhesitating but qualified Yes.[1] A Royal Commission has now been appointed to inquire into the existing scheme, and to report what, if any, changes, extensions, or developments should be made in its scope, and in the administrative, financial, and medical arrangements set up under it. The scheme may therefore be considered as still in the experimental stage, and the future of private medical practice as still rather obscure.

[1] See BRITISH MEDICAL JOURNAL, August 2nd, 1924, pp. 173, 175.

PROFESSIONAL ORGANIZATION

The strong sense of *esprit de corps*, which adds so greatly to the value and happiness of undergraduate medical study, is equally an advantage to the qualified practitioner. In these days no doctor, whatever his position or the nature of his work, can safely stand aside from his fellows. Medical men and women must therefore band themselves together for the common protection of their profession and themselves. Experience shows that individuals and isolated bodies of medical practitioners are always handicapped when they attempt to defend their own interests unsupported by their fellows against organized bodies. This applies, whether the organized bodies are Government departments, local authorities, or bodies of workmen. While the individual doctor is quite capable of dealing with the individual patient, he requires an organization at his back when he is dealing with other organizations. The first step after qualification should be to become an active member of the British Medical Association. A young practitioner will find in the meetings of the local Division of the Association, and in the Annual Meetings held in large medical centres, many opportunities, not only of keeping abreast with the progress of medicine, but also of friendly intercourse with colleagues. Another thing that no new graduate should fail to do is to join one of the professional societies which undertake individual legal defence of their members.

The British Medical Association was founded in 1832 to promote the medical sciences and to maintain the honour and interests of the profession. It is the great general forum of the profession, and it is the one organization which acts for the profession as a whole in times of stress. A brief note on the objects and constitution of the Association, and the advantages offered to members, will be found at page 450. The record of ninety-two years' work shows that professional organization, directed with wisdom and imagination, can successfully combine service for its members with service for the public. Greater work remains to be done in each direction, and we look confidently to the rising generation of doctors to take their share.

THE NEW ERA IN MEDICAL EDUCATION

A FULL account of the resolutions and recommendations of the General Medical Council which have applied since the beginning of 1923 is given in the present issue of the JOURNAL. Here we propose to indicate some of the salient features of the scheme, both of study and of examination.

The Revised Curriculum

The minimum age for registration as a medical student has been increased from 16 years to 17 years. Formally, the length of the medical curriculum is not added to, practically it is, by transferring to preliminary study and examination the subjects of elementary physics and chemistry in their purely scientific aspects. In their applications to the professional courses—as in biophysics, biochemistry, and pharmacological chemistry—appropriate instruction is to continue throughout the curriculum, and is to be tested by examination, so that the student shall no longer be able to put behind him as passed and done with the knowledge which he acquired as a preliminary. If he has had no facilities at a secondary school or otherwise for obtaining what is necessary for the preliminary examination in these subjects, then he can come for it to the university or college, but study there will not count for the medical curriculum.

In biology it is understood that comparatively few secondary schools are equipped for elementary tuition, but the Council has suggested an ingenious arrangement for utilizing the work of such schools as are qualified for the purpose. The examination will not be "pre-curriculum," but the instruction may be so, and a licensing body can allow students who so desire to sit for the examination immediately after matriculation. Here again, however, the applications of biology to medicine, surgery, and midwifery will continue to receive attention throughout the courses.

The Council attaches great importance to the reservation of sufficient time for the later subjects of study, free from all worries about passing the examinations of the earlier parts. To that end it recommends what is practically a block system. A minimum of three years should be available, not merely after the courses of anatomy and physiology have been taken, but after the professional examinations have been passed. The value of this proposal is obvious.

Examination Reform

Another notable feature is that in assessing marks in the several examinations account may be taken of "duly attested records of the work done by the candidate throughout his course of study" in the subject. This is an effort to meet the long felt difficulty that a man's mental agility, or the want of it, counts far too much in his being passed or rejected. The difficulty is real, but the remedy is not easy, and the Council is wise in the cautious approach it makes towards a solution. Where, as in the colleges, a student will only by chance come before his own teacher as an examiner, absolute impartiality in the attested records will be necessary. A teacher must not play for popularity with students by too easy certification of diligence or success in class. On the other hand, at the universities, where the teacher is always one of the examiners, no personal like or dislike of a student must influence the report of the internal to the external examiner. The class records should, of course, be available, but the scheme will put a serious ethical obligation on all concerned, and the Council will doubtless watch its operation with keen and critical interest.

Besides the resolutions of the General Medical Council in regard to professional education and examination (see pages 403-406) a series of additional resolutions was adopted on May 26th, 1922, as follows:

> (*a*) That throughout the whole period of study the attention of the student should be directed by his teachers to the importance of the preventive aspects of Medicine,
>
> (*b*) That each Licensing Body should make adequate arrangements for the effective correlation of the several subjects of study throughout its curriculum,
>
> (*c*) That the teaching of Anatomy and Physiology should include as a regular part of the courses the demonstration on the living human body of structure and function,
>
> (*d*) That the curriculum should be so arranged that a minimum period of three years shall in every case be available for study after the completion by the student of the Professional Examinations in Anatomy and Physiology held at the close of the second year,
>
> (*e*) That the curriculum should be so framed as to afford sufficient opportunities for the study, during the last three years of the course, of Physics, Chemistry, Biology, Anatomy, and Physiology in their practical applications to Medicine, Surgery, and Midwifery, and that the student's knowledge of these applications should be subject to test in the Final Examination,
>
> (*f*) That before the student is admitted to his clinical appointments he should have received practical instruction in clinical methods and in the recognition and interpretation of physical signs,
>
> (*g*) That instruction should be given, in the courses of Forensic Medicine and Public Health or otherwise, on the duties which devolve upon practitioners in their relation to the State, and on the generally recognized rules of medical ethics. Attention should be called to all *Notices* on these subjects issued by the General Medical Council.

Training in Preventive Medicine

The first of these resolutions should be borne in mind by every teacher throughout the whole curriculum, and not merely in the clinical subjects. As indicated in a questionary issued by the Council in 1918, all the earlier subjects—Physics, Chemistry, Biology, Physiology, Anatomy, and, of course, Pathology, Bacteriology, and Therapeutics also—afford opportunities from the very beginning for instilling into the mind of the student the necessity for his keeping constantly in view in all the

advice and treatment he may give throughout his professional life, the primary importance of promoting the general health of those who entrust themselves to his care, and of preventing trivial ailments from developing into definite disease In his presidential address to the Council in 1918 Sir Donald MacAlister pointed out that if "the efficient practice of their profession" by doctors was "to be judged by new civic standards, and to be carried on under new conditions," the student would have to be trained accordingly The era of that training began formally in 1923 Though no details are given in resolution (*a*), and though it may require some change of orientation by teachers who have hitherto given no special heed to the bearings of their subject on the maintenance of health and the prevention of disease, yet they will doubtless join heartily in what will indeed be an epoch-making advance in medical education in this country Its reflex and reward will surely be found as time passes in a diminution of sickness and prolongation of life, in the raising of the present standards of physical health and national welfare

New Rules for the D P H

It is important to note the bearing that this development of the teaching of disease prevention to all students of medicine has upon the stringent rules which came into force for new candidates at the beginning of 1924 for the obtaining of diplomas in public health (see page 441) Fears are expressed that the stiffening of the requirements will discourage those who intend to go into ordinary medical practice from taking the additional qualification which would specially fit them for co-operation with the health officer of their district The reply is twofold Henceforward all new practitioners will have received tuition qualifying them generally for such co-operation, and in addition they are already being systematically educated in "the duties which devolve upon practitioners in their relationship to the State" The balance, therefore, seems clearly on the right side as to the ordinary practitioner and there will unquestionably be advantages in strengthening the education of those who aspire to a life spent in the public health service In America, it may be mentioned the standard of study for a "doctorate" in public health will at most medical schools probably correspond with that for the new health diploma in this country

THE NUMBERS OF THE MEDICAL PROFESSION

A Review of Forty-eight Years

Since the year 1876 the General Medical Council has kept an analytical record of the number of names entered in, added to, or removed from the *Medical Register* in each twelve months The *Medical Register* has been published annually since the Council was constituted under the first Medical Act of 1858, but before 1876 no such data as these were ascertained or preserved

In order to gain a general view of the numerical strength of the medical profession during the past forty-eight years we have extracted from the tables and set down in parallel columns the total number of names in the *Medical Register* on December 31st of each year, and the numbers added annually by registration between 1876 and 1923

Numerical State of the Medical Register

Year	Names added in Year	Total No on Dec 31	Year	Names added in Year	Total No on Dec 31
1876	1 009	22 713	1900	1 345	36,355
1877	940	22 841	1901	1 318	36 912
1878	996	22 600	1902	1 275	37 232
1879	996	22 516	1903	1 233	37 878
1880	1 123	22 936	1904	1 163	38 432
1881	1 053	23 275	1905	1 240	39 060
1882	1 171	23 801	1906	1 197	39 529
1883	1 304	24 517	1907	1 221	39 627
1884	1 323	25 321	1908	1 137	40 257
1885	1 377	25 938	1909	1 143	39 818
1886	1 431	26 452	1910	1 062	40 23
1887	1 531	27 246	1911	1 042	40 913
1888	1 184	27 939	1912	1,157	41 433
1889	1 305	28 348	1913	1 168	41 940
1890	1,266	29 163	1914	1 433	42,378
1891	1 345	29 555	1915	1,526	43,225
1892	1 513	30 590	1916	1,402	43 431
1893	1 579	31 644	1917	1 134	43 819
1894	1 426	32 637	1918	1 077	43 926
1895	1 446	33 601	1919	1 342	44,510
1896	1 505	34 478	1920	1 457	44 761
1897	1 230	34 642	1921	1 760	45 468
1898	1 210	35 067	1922	1 983	46 476
1899	1 351	35 836	1923	2 462	48 140

The following table indicates the varying proportion of registered medical practitioners to population during the period under review It shows the population of the British Isles at each decennial census since 1881 and the corresponding number of names on the *Medical Register*

Proportion of Practitioners to Population

Year	Registered Practitioners	Population of British Isles
1881	23 275	35,241 482
1891	29 555	38,104 975
1901	36 912	41 976 427
1911	40 913	45 379 570
1921	45 468	47,261 570

These figures reveal a general tendency towards an increase in the ratio of doctors to population The number of registered practitioners at the end of 1921 was almost exactly double the number at the end of 1876 but the population within that period only increased by about 50 per cent During the year 1923 the new medical registrations numbered no fewer than 2,482—by far the largest entry on record—and there was a net increase of 1,634 names Owing to the large increases during the past three years there is now for the first time approximately one name in the *Medical Register* to every thousand of population

THE GENERAL MEDICAL COUNCIL

The General Medical Council was set up by the first Medical Act of 1858 and now consists of thirty-eight members six of whom are elected by the medical profession, five nominated by the Privy Council, and the remainder are representatives of the universities and such medical corporations of the United Kingdom as have a statutory right to issue diplomas Under the Dentists Act, 1921, three additional members have been appointed by the Privy Council for dental business they must be qualified and registered dentists and members of the Dental Board The Council's headquarters are at 44 Hallam Street, Portland Place, W 1, and it has branch offices at 20, Queen Street, Edinburgh, and 35, Dawson Street, Dublin Its duties are to control the medical and dental professions in the interests of the general public, and to that end to maintain a register of legally qualified medical practitioners It is admission to the *Medical Register*, and not the possession of a degree or diploma, that constitutes a person a legally qualified practitioner The Council is bound to admit to the *Medical Register* those who hold the qualifications granted by the bodies represented among its members, but it exercises supervision through the Privy Council over the terms on which those bodies grant such diplomas or degrees and it can erase from the *Medical Register* or the *Dentists Register* the name of any medical man or dentist who has been convicted before a court of law of an ordinary crime or of a serious offence against public order, or who is proved before the Council itself to have been guilty of certain actions which the Council regards as professionally "infamous" Its disciplinary powers are limited to legally qualified practitioners, and it has no control whatever over irregular practitioners of any kind In that respect it differs from the Midwives Board in England and Scotland, which can penalize unqualified midwives even if they make no pretence to be on the midwives roll, and from the Dental Board of the United Kingdom, which now that the Dentists Act 1921, is in operation can prosecute unregistered persons practising dentistry

An account of the recommendations that the Council has drawn up in respect of the education of medical students here follows

Registration of Medical Students

The Council recommends that every intending student of medicine should be registered as such at one of its three offices whose addresses are given below

Candidates must produce evidence (*a*) that they have attained the age of 17 years, (*b*) that they have passed an examination in general education which is accepted for matriculation or entrance to the Faculties of Arts or Pure Science in a university in the United Kingdom, (*c*) and in addition thereto that they have passed an examination in elementary chemistry and elementary physics conducted or recognized by one of the licensing bodies

Application for registration should be addressed to the Registrar for the division of the United Kingdom in which the applicant is residing—England and Wales, or Scotland, or Ireland. It must be made on a special form, which can be obtained from one of the offices of the General Medical Council itself or from one of the various licensing bodies and medical schools

The regulations with regard to registration apply equally to medical and dental students, with the exception that in the case of the latter pupilage with a registered dental practitioner may be regarded as a commencement of professional study, and that applications for registration should be addressed to the *London office only*

PROFESSIONAL EDUCATION

The rule is that it is only from the date which appears against his name in the *Students Register* that the medical student's career officially begins, thereafter five years must pass before he can present himself for the final examination for any diploma which entitles its lawful possessor to registration as a qualified medical practitioner under the Medical Acts, but to meet the circumstances brought about by the dates at which sessions of the medical schools begin and end, *the close of the fifth year may be reckoned as occurring at the expiration of fifty-seven months from the* date of registration. In any case, the period of five years must be one of bona-fide study, and in every course the following subjects should be included

(i) Elements of General Biology, including an introduction to Embryology. This course, if the Licensing Bodies permit, may be taken before registration, and the examination may be passed immediately after registration

(ii) Chemistry, Physics, and Biology in their application to Medicine

(iii) Human Anatomy and Physiology, including Histology, Elements of Embryology, Biochemistry, and Biophysics

(iv) Elementary Bacteriology, prior to regular clinical appointments

(v) Pathology, general, special, and clinical, and Morbid Anatomy

(vi) Pharmacology and Materia Medica, to be taken concurrently with clinical instruction

(vii) Forensic Medicine, Hygiene and Public Health

(viii) Medicine, including Applied Anatomy and Physiology, Clinical Pathology and Therapeutics, Children's Diseases, Acute Infectious Diseases, Tuberculosis, Mental Diseases, Skin Diseases, and Vaccination

(ix) Surgery, including Applied Anatomy and Physiology and Clinical Pathology, Anaesthetics, Diseases of the Eye, Ear, Throat and Nose, Radiology, Venereal Diseases, and Orthopaedics

(x) Midwifery and Diseases of Women, including ante-natal conditions and infant hygiene

The Council recommends that during the last three of the five academic years clinical subjects shall be studied

The first two years must be passed at a school of medicine recognized by any of the licensing bodies enumerated in the schedule to the Medical Act of 1858, and the remainder must be devoted to clinical work at any public hospital or dispensary at home or abroad which is recognized by a licensing body

SPECIAL CONSIDERATIONS

The requirements of the General Medical Council in respect of the education of those who desire to enter the medical profession have now been given in outline, but before leaving this part of the subject the steps which the aspirant should take may be rehearsed in their due order

(1) Pass an examination in arts,

(2) Pass an examination conducted or recognized by a licensing body in elementary physics and elementary chemistry

(3) Enter himself at a medical school recognized by one of the Licensing Bodies

(4) Obtain registration as a medical student

(5) Study for a *minimum of five years* certain prescribed subjects,

(6) Meanwhile pass sundry intermediate examinations, and at the end of the fifth year pass a "qualifying examination" which will entitle him to receive from a licensing body a legal authority to practise

The Minimum Period.—It must be remembered that the period of five years is a minimum, more is often required even by the man of good abilities and reasonable industry. Besides these qualities a student, to obtain a registrable qualification in the minimum period of five years, or fifty-seven months, must have a considerable amount of good luck, in other words, he must keep in good health through every term, *and never fail at a single examination*. Thus, for instance, before presenting himself for any examination he must be "signed up" for the subjects covered by that examination, this means that his teachers have to certify that he has diligently attended the required number of lectures or classes in the subjects in question. If, however, the student happens to be ill during the term when such lectures or classes are taking place he may miss enough of them to make it impossible for him to be signed up. Then, again, should he fail to satisfy the examiners at some examination, he cannot present himself for re-examination for at least three months. This generally entails further consequences, because, apart *from the student's success at the next stage in his career being imperilled by the need* for restudying the subjects in which he has failed, the Examining Boards usually insist upon a definite interval elapsing between one examination and the next. Further, many Boards have refused to recognize lectures and classes which have been attended before the student has passed the requisite examination in earlier subjects, and the Council now recommends that the professional examinations in anatomy and physiology be passed before the minimum period of three years' subsequent study be entered on, in other words, *no clinical study should count as such until these examinations have been successfully completed*. Failure at an examination may thus not only mean deferment of the date of examinations, but deferment of the beginning of the student's study of certain subjects. It is thus exceedingly easy for a student to fail to qualify in five years, and, as a fact, the majority of students take longer.

In speaking of the minimum period, it is to be remembered also that that time is only sufficient to gain a registrable qualification, such as a Bachelorship of Medicine or Surgery or the diplomas of the Royal Colleges. Those who wish to take a higher qualification—for instance, the F.R.C.S. Eng.—must prolong their work for another year or more. So, too, must in some cases those who desire to convert their Bachelorship into a Doctorate. This may entail further formal examination, but at some universities the M.D. is obtainable on presentation of a thesis when the Bachelor has attained a certain age and has practised for a certain number of years. However, a student's career proper may be considered, perhaps, to have ended when he obtains his first registrable qualification, for while preparing himself for any further tests he can, and usually does, hold some junior appointment which more or less covers his expenses.

MEMORANDUM ON STUDENTS' REGISTRATION

The following memorandum has been drawn up by the Registrar of the General Medical Council as to the procedure for those who desire to be registered as medical or dental students.

The requirements for the registration of medical and dental students are the same, and every intending student should, in his own interest, register as soon as he commences his professional curriculum.

A recognized examination in general education must first be passed. If the student intends to obtain a university degree, he should apply to the university he selects for information as to its matriculation requirements in arts or pure science, or as to any examinations which may be accepted in lieu of its matriculation examination. If the student intends to obtain a qualification from one of the licensing corporations (these are the Conjoint Boards in England, Scotland, and Ireland, the Society of Apothecaries of London, and the Apothecaries' Hall of Dublin) any of the examinations indicated below will be accepted. The subjects required are (1) English, (2) Mathematics (elementary), (3) a language other than English, and (4) an additional subject or subjects, as required by the regulations of the particular examination, to be chosen from the following—namely, *History, Geography*, Physical Science, Natural Science, Latin, Greek, Hebrew, French, German, or other language accepted by the university for matriculation.

The requirements of the preliminary examination in general education being satisfied, it is then necessary to pass an examina-

tion in Elementary Chemistry and Elementary Physics which is conducted or recognized by one of the licensing bodies—that is university or corporation. The student should write to the body whose qualification he desires to obtain (a list will be found below) for information in regard to its requirements for this examination.

These two examinations having been passed and the student having attained the age of 17 years *he should apply to one of* the universities or one of the medical schools for admission in order to commence therein his professional curriculum. Immediately his course of medical study has been begun he should apply to the Dean of the school or to the Registrar of one of the branches of the General Medical Council for a form of application for registration as a student and should have it completed and sent in to one of the Branch Councils as soon as possible. There is no fee for this registration. The medical curriculum will extend for at least five years and the dental curriculum for at least four years *from the date of* registration as a student.

A student who has studied the subject of elementary biology at an institution recognized by one of the licensing bodies may if the *body sees fit, be admitted to the professional* examination in this subject immediately after his registration as a student. For information in regard to this he should apply to the body whose medical qualification he seeks.

A dental student may commence his curriculum at he so desires as a pupil with a registered dental practitioner but it is desirable if possible that he should commence professional study at a dental school. If however he is apprenticed to a dental practitioner he may have to take out a course of four years of dental mechanics *and this will have the effect of* lengthening the duration of his curriculum to five or six years instead of four.

The addresses of the Branch Registrars are:

General Medical Council 44, Hallam Street, Portland Place, *London* W.1.
Scottish Branch Council, 20 Queen Street, Edinburgh.
Irish Branch Council, 35, Dawson Street, Dublin.

Examining Bodies in Preliminary Education

The following is a list of the officials of the examining bodies in preliminary education, with the names of the examinations—in parentheses:

Registrar, Queen's University of Belfast, Belfast. (Matriculation.)
Registrar, The University, Bristol. (Matriculation, School Certificate, or Higher School Certificate.)
Assistant Registrary, The University, Cambridge. (Previous.)
Secretary, Cambridge Local Examinations Syndicate, Buildings, Cambridge. (School or Higher School Certificate.)
Director, Central Welsh Examination Board, Cardiff. (Senior Certificate.)
Registrar, University of Dublin, School of Physic, Dublin. (Junior Freshman, Special Preliminary, Junior Exhibition, or Examination to first, second, third, or fourth year in Arts.)
Dean, University of Durham, School of Medicine, Newcastle-on-Tyne. (First School Certificate or Matriculation.)
Registrar, Irish Conjoint Board, Royal College of Surgeons, Dublin. (Preliminary Examination.)
Registrar, National University of Ireland, Dublin. (Matriculation.)
Joint Commissioners, Intermediate Education Board for Ireland, 1 Hume Street, Dublin. (Middle and Senior Grade Examinations.)
Academic Registrar, The University of London, South Kensington, London, S.W.7. (Matriculation or General Schools Certificate.)
Secretary, Northern Universities Joint Matriculation Board, 36a Oxford Road, Manchester. (Matriculation or Senior School Certificate.)
Registrar, The University, Oxford. (Responsions or Moderations.)
Secretary, Oxford and Cambridge Schools Examination Board, Schools Examination Office, Balliol College, Oxford. (School or Higher School Certificate.)
Secretary, Oxford Local Examinations, University Press, Oxford. (School or Higher School Certificate.)
Secretary, College of Preceptors, Bloomsbury Square, London, W.C.2. (Senior Certificate.)
Secretary, Educational Institute of Scotland, 47 Moray Place, Edinburgh. (Preliminary Medical Examinations.)
Secretary, Scottish Education Department, 1 Queen Street, Edinburgh. (Leaving Certificate.)
Secretary, Scottish Universities Entrance Board, 31 North Street, St Andrews. (Scottish Universities Preliminary Examination.)

Licensing Bodies

The following is a list of the officials of the various licensing bodies to whom communications should be addressed:

Secretary, English Conjoint Board, 8 Queen Square, Bloomsbury, W.C.1.
The Clerk, Society of Apothecaries, *Blackfriars*, E.C.4.
Registrar, The University, Oxford.
Registrary, The University, *Cambridge*.
Secretary, University of Durham, School of Medicine, Newcastle-on-Tyne.
The Principal, University of London, South Kensington, S.W.7.
Registrar, Victoria University, Manchester.
Registrar, The University, Birmingham.
Registrar, The University, Liverpool.
Registrar, The University, Leeds.
Registrar, The University, Sheffield.
Registrar, The University, Bristol.
Registrar, University of Wales, Cathays Park, Cardiff.
Secretary, Scottish Conjoint Board, 29 Lauriston Place, Edinburgh.
Dean of the Faculty of Medicine, The University, Edinburgh.
Registrar, The University, Glasgow.
Secretary of the Medical Faculty, The University, Aberdeen.
Secretary, The University, St Andrews.
Secretary, Irish Conjoint Board, Royal College of Surgeons, Dublin.
Registrar, Apothecaries Hall of Ireland, 95 Merrion Square, Dublin.
Medical Registrar, The University, Dublin.
Registrar, National University of Ireland, Dublin.
Registrar, Queen's University of Belfast, Belfast.

Medical Schools

The following is a list of officials of the Medical Schools of Great Britain and Ireland other than the universities:

Secretary, University of Durham, College of Medicine, Newcastle-on-Tyne.
Dean of the Medical School, St Bartholomew's Hospital, London, E.C.1.
Dean of the Medical School, Charing Cross Hospital, W.C.2.
Dean of the Medical School, St George's Hospital, S.W.1.
Dean of the Medical School, King's College, Strand, W.C.1.
Dean of the Medical School, King's College Hospital, S.E.5.
Dean of the Medical School, London Hospital, E.1.
Dean of the Medical School, St Mary's Hospital, W.2.
Dean of the Medical School, Middlesex Hospital, W.1.
Dean of the Medical School, St Thomas' Hospital, S.E.1.
Dean of the Medical School, University College Hospital, W.C.1.
Dean of the Medical School, Welsh National School of Medicine, Cardiff.
Dean of the Medical School, University College, Swansea.
Dean of the Medical School, University College, Dundee.
The Misses Queen Margaret College, Glasgow.
Registrar, School of Physic, Trinity College, Dublin.
Registrar, University College, Cork.
Registrar, University College, Dublin.
Registrar, University College, Galway.

PROFESSIONAL EXAMINATION

The Council's Recommendations

The following recommendations of the General Medical Council in regard to professional examinations for medical and surgical qualifications were adopted in May, 1922:

1. In order to secure due continuity and sequence in medical study two or more Professional Examinations in the earlier subjects should be held antecedently to the Final Examination in Medicine, Surgery, and Midwifery.

2. Three years at least should intervene between the date of passing the Professional Examination in Anatomy and Physiology and that of admission to the Final Examination in Medicine, Surgery, and Midwifery.

3. A candidate remitted in any subject of a Professional Examination should before he is readmitted to examination therein be required to produce satisfactory evidence that he has during the interval of remission, pursued the study of the subject in which he was rejected. Candidates who obtain less than 30 per cent. of the marks in any subject should be remitted for a longer period than three months.

4. In all the Professional Examinations sufficient time should be assigned to practical work in order to test the thoroughness of the candidate's knowledge and to encourage practical methods of study.

5. Candidates in all their examination work should be carefully supervised.

6. Two examiners should always participate in the oral examination of a candidate, except in subordinate parts or practical examinations.

7. In all written examinations the questions in each subject should be submitted for the approval of all the examiners in that subject.

8. In all written examinations an average of at least half an hour should be allowed for a candidate to answer each question.

9. It is desirable that examiners, and in particular those for the Final Examination in Medicine, Surgery, and Midwifery, should be appointed or re-elected for at least three consecutive years.

10. Whatever may be the system of marking, the percentage for a pass in each subject should be not less than 50.

11. In the regulations for the several Examinations it should be provided that examiners in assessing marks be empowered to take into account the duly attested records of the work done by the candidate throughout his course of study in the subject of the examination.

12. The Final Examination in Medicine, Surgery, and Midwifery, with the exception of the Clinical and Practical Examination in Midwifery and Gynaecology, must not be passed before the close of the fifth academic year of medical study.

13. The three portions of the Final Examination in Medicine, Surgery, and Midwifery should not be further subdivided into sections which may be entered for or passed separately.

14. Compensation in respect of marks as between the three different portions of the Final or Qualifying Examination—namely, Medicine, Surgery, and Midwifery—is contrary to the intention of the Medical Act (1886).

15. The Final Examination should include clinical and practical examinations in Midwifery and Gynaecology.

16. The clinical examinations in Medicine, Surgery, and Midwifery should be held in properly-equipped hospitals or examination halls well provided with suitable patients.

17. In the examinations in clinical medicine at least one hour, and in clinical surgery at least half an hour, should be allotted to the candidate for the examination of, and report on, his principal case.

18. In Medicine, in Surgery, and in Midwifery no candidate should be allowed to pass who fails to obtain 50 per cent. of the aggregate marks assigned to the whole examination or who fails to obtain 50 per cent. of the marks assigned to the clinical examination or who fails to obtain 50 per cent. of the aggregate of the marks assigned to the written and oral examination. In

Midwifery, where a clinical examination is not held, the duly attested records of the work done by the candidate in clinical midwifery must be presented to the examiners for assessment in the Final Examination, and no candidate should be allowed to pass who fails to obtain 50 per cent of the aggregate marks assigned to Clinical and Practical Midwifery and Gynaecology

19 The Final Examination should include the examination of secretions, the testing of urine, clinical microscopy, and prescription writing, and there should always be an oral examination in Medicine, Surgery, and Midwifery, which should include an examination on pathological specimens

20 At the Final Examination each candidate should be submitted to a practical and oral examination in Pathology (macroscopic and microscopic), unless this has been included in a Professional Examination preceding the Final Examination

21 Whatever be the method of entry for the Final Examination all candidates should be required to complete the three portions of the Final Examination within a period of nineteen months

The English Universities.

THERE are eleven universities in England and Wales, and some account of each of them follows They all have now fully developed medical faculties Until recently the only exception was the University of Wales, whose constituent colleges are those of Aberystwyth, Bangor, Cardiff, and Swansea This university grants degrees, and has laid down a six years' curriculum for candidates for the M B and B Ch degrees, and it now provides, at the Welsh National School of Medicine at Cardiff (see page 412), instruction in all the subjects of the medical curriculum

UNIVERSITY OF OXFORD

THE professional degrees conferred by this university are those of Bachelor of Medicine (B M), Bachelor of Surgery (B Ch), Doctor of Medicine (D M), and Master of Surgery (M Ch) It also grants a diploma in *Public Health* and a diploma in Ophthalmology On receiving the B M the candidate is entitled to registration by the General Medical Council In favourable circumstances this degree and the B Ch may be obtained in six or seven years from matriculation Before receiving either, the candidate must have taken a degree in Arts (B A), for which three years' residence within the university is necessary This, however, does not necessarily mean deferment of professional study for that period, for some of the subjects chosen for the final stage of the arts course may be the same as those in which examinations would in any case have to be passed for the medical degree

In accordance with a statute which came into force on October 7th, 1920, women may be matriculated and admitted to degrees in the university The statute is retrospective under certain conditions Before matriculation a woman must have been admitted as a member of one of the five societies of women students (Lady Margaret Hall, Somerville College, St Hugh's College, St Hilda's Hall, or the Society of Oxford Home Students) Women members of the university are admitted to all degrees, except those in Divinity, under the same conditions as those laid down for men in regard to examinations, courses of study, and fees, and under corresponding conditions as to residence at the university Among the university diplomas open to women are those in anthropology, ophthalmology, and public health

A candidate may obtain the B A degree in either of the following ways, of which the former constitutes the normal course for medical students

(*a*) By passing Responsions, the Scripture examination, some of the preliminary examinations in the Natural Science School,[1] or the Honour School of Mathematics in the first public examination, and one of the final honour examinations The Final Honour School of Natural Science (Physiology) is that usually taken

(*b*) By passing Responsions (or one of the examinations which are accepted as equivalent) Moderations, a Scripture examination, or in the event of a candidate objecting an examination on some substituted book and the Final Pass School in three subjects, two of which may be the same as two of the preliminary examinations in natural science [1]

[1] The four subjects of the medical preliminary examinations are four of the subjects in the natural science preliminary and can be commenced directly after passing Responsions.

Responsions and the preliminary examinations in Natural Science may be passed before a candidate is a member of the university[1], Moderations and Scripture can be passed in or after the second term, the final pass school may be taken any time after Moderations, a final honour school may be taken at the end of the third or fourth academical year—that is, within nine or twelve terms respectively, the preliminary examinations of the Natural Science School may be taken as soon as Responsions have been passed

PROFESSIONAL DEGREES

To obtain the B M , B Ch degrees the candidate must first pass in four of the subjects of the Preliminary Examination of the Natural Science School—namely, physics, chemistry, zoology, and botany

He then has two further examinations to pass—the First B M and the Second B M These take place twice a year, the first on the Thursday, the second on the Wednesday, of the eighth week of Michaelmas and Trinity terms Every candidate at the First B M is examined in human anatomy, in physiology, and in organic chemistry, but is excused from physiology if he has obtained a first or second class in the Honour School of Physiology, and from organic chemistry if he has satisfied the examiners in Part I of the Honour School of Chemistry Once he has passed this examination he can, on production of certain certificates, be examined as soon as he pleases in pathology, forensic medicine, and hygiene, materia medica, and pharmacology (subjects of the second examination), but cannot present himself for the remaining subjects—medicine, surgery, and midwifery—until the eighteenth term from the day of his matriculation, and not until a period of at least thirty-three months has elapsed from the date of his passing the first examination,[2] and he must pass in all the three subjects at one and the same time

Before admission to the second B M examination the student must produce certificates of instruction from a medical school recognized by the university of having acted as clinical clerk and dresser, each for six months, and as *post-mortem* clerk for three months, of attendance on labours, of instruction in infectious and mental diseases and ophthalmology, and of proficiency in vaccination and the administration of anaesthetics [3] He must also produce certificates of attendance in laboratory courses in pathology, bacteriology, and pharmacology, either in Oxford or in a recognized medical school

D M AND M CH DEGREES

A Bachelor of Medicine who wishes to proceed to the D M must have entered his thirtieth term and must present a dissertation for approval by the appointed examiners on a subject previously approved by the Regius Professor of Medicine If a candidate for the M Ch he must have entered his twenty-first term and must pass an examination, which is held in June

Examinations for the Diploma in Public Health are held in Trinity and Michaelmas terms, that for the Diploma in Ophthalmology is held annually, commencing on the third Monday in July For the Diploma in Ophthalmology attendance on a twelve months' course of clinical ophthalmology in hospitals or institutions recognized for the purpose by the Board of the Faculty of Medicine, and on a course of instruction in Oxford lasting two months, is obligatory Candidates must have their names on the *Medical Register* of the United Kingdom, unless, being Bachelors or Doctors of Medicine of universities outside the United Kingdom, they have obtained special permission from the Board of the Faculty of Medicine

TEACHING

The several colleges provide their undergraduate members with tutors for all examinations up to the B A degree In addition, the university provides certain courses of instruction, including lectures, demonstrations, and practical

[1] Membership is conferred by matriculation and by becoming either a member of a College or a Hall or a *non collegiate* student

[2] For students commencing medical study after December 31st, 1925 this period will be thirty three months

[3] For the certificates that will be required from candidates proceeding to the new Regulations of the General Medical Council see *Examination Statutes*, Clarendon Press, Oxford, 1924 edition (in the press)

work which cover all the subjects of the Preliminary Examination and First B M, and in part those of the Final Examination

Scholarships

Most colleges grant scholarships open to intending medical students of £60 a year tenable for four years in natural science, chemistry, physics and biology. Exhibitions of varying value are also awarded in these subjects at two colleges (University and Pembroke) there are medical entrance scholarships of £100 a year. Particulars can be obtained on application to the college tutors. Scholarships for women are also offered by the various women's colleges from the principals of whom details of the examinations may be obtained. A Radcliffe Travelling Fellowship of £300 a year tenable for two years is conferred annually; candidates must have taken the B M degree. A Philip Walker studentship in Pathology of £200 a year tenable for two years is awarded biennially for the encouragement of research in pathology, as also are the Polleston Memorial Prize and the Radcliffe Prize (£50) for research in natural science (including pathology) and the three Theodore Williams Scholarships in Anatomy, Physiology and Pathology of the value of £50 each tenable for two years. A Radcliffe Scholarship in Pharmacology of £50 for one year open to the University is awarded annually by the Master and Fellows of University College. A Burney Yeo, King's College Hospital Scholarship of £80 is awarded annually.

Fees

An annual fee of £4 10s is paid to the university for the first four years, being reduced to £1 when the B A has been taken. For the degree the fees are: the B A., £7 10s; the B M. and B Ch., £14; the D M., £25; the M Ch., £12. College fees, varying in amount, are paid for the first four years of membership and in taking degrees. Tuition fees vary from £21 to £50. The minimum annual cost of living during the three university terms may be regarded as not less than £160 or for women no less than £140.

For further information application may be made to Dr. E. W. Tinley Walker, Dean of the School of Medicine, University of Oxford.

UNIVERSITY OF CAMBRIDGE

THE professional degrees given by this university are those of Bachelor of Medicine (M B.) and Bachelor of Surgery (B Chir.), each of which entitles the possessor to admission to the *Register* by the General Medical Council, and the higher degrees of Doctor of Medicine and Master of Surgery. It also grants diplomas in Tropical Medicine, in Public Health, in Hygiene, in Psychological Medicine, and in Medical Radiology and Electrology to medical practitioners not necessarily graduates of the university. Information regarding these diplomas will be found in later sections under the headings Tropical Medicine, Psychological Medicine, Public Health, and Radiology. A candidate for the M B., B Chir. degrees need not possess a degree in arts, it is sufficient if he has passed the Previous examination or some other examination accepted by the university as its equivalent. Most students, however, are advised to take the B A. degree, preferably by obtaining honours in the Natural Sciences Tripos at the end of their third year. Under the new regulations the attainment of a sufficient standard in chemistry or in physiology in this Tripos will secure exemption from the corresponding tests in the First and Second M B. examinations. Women students, members of Girton or Newnham College, are now admitted to the M B. examinations.

Professional Examinations

To obtain the M B. degree the candidate must pass three examinations; those who are finally successful may receive the B Chir. degree (which is a complete registrable qualification) without further examination.

First M B.—This comprises (1) general and inorganic chemistry, (2) mechanics, (3) physics, (4) elementary biology. The parts may be taken together or separately. In either case the candidate before admission to examination must have satisfied the requirements in respect of the Previous examination and paid the matriculation fee. Certain exemptions from the First M B. examination are allowed; the regulations may be obtained from the Registrary. The complete examination is held twice a year—in October and June; an additional examination, in Parts 2 and 4, is held in December.

Second M B.—This examination comprises Part I, organic chemistry, Part II, human anatomy and physiology, Part III, elementary pharmacology, including pharmaceutical chemistry and the elements of general pathology. No student is admitted to the first part of the second examination until he has passed the first part of the first examination. No student is admitted to the second part of the second examination until he has passed all parts of the first examination. No student is admitted to the third part of the second examination until he has passed the first and second part of the second examination. No one may enter for Part III until he has passed Parts I and II. The candidature is reckoned up in all three subjects and has direction for one academic year. The examination for Parts I and II is held in December and June, that for Part III in October and April.

Third M B.—This is divided into two parts, to neither of which the candidate is admitted until he has passed the examinations previously mentioned. A candidate for the first part which deals with the principles and practice of surgery (including special pathology) and midwifery and diseases peculiar to women must have completed five years of medical study and be signed up in these subjects and have completed two years and a half of hospital practice. Before admission to the second part the candidate must have completed five years of medical study and be duly signed up in all subjects and have completed five years of hospital practice. He must also pass examinations showing that he has fulfilled all the requirements as well as the requirements of the General Medical Council. The examination is in the principles and practice of physic (including diseases of children), mental diseases and medical jurisprudence, pathology (including bacteriology and preventive medicine) and pharmacology (including therapeutics and toxicology). The Third M B. examinations are held twice a year—in June and December.

Act for the M B.—Before receiving his M B. degree a candidate who has been successful at the final M B. examinations has to write a thesis. This he reads in public on an assigned day, and is then questioned concerning it and other subjects of medicine by the Regius Professor of Physic. If approved at this test he is then certified as having "kept the Act" canonically, and in due course receives his degree. Medical degrees may be taken in absence by those living abroad, the candidate sending to the Regius Professor of Physic a dissertation, which is laid before the Degrees Committee.

The Higher Degrees

The M D. degree may be taken by a bachelor of medicine of three years' standing after writing a thesis approved by the M.D. Degrees Committee, and keeping a further Act, at which he reads his thesis and is examined thereon. Previously to the Act being kept a topic taken from the general subject of his thesis (whether it be physiology, pathology, pharmacology, practice of medicine, State medicine, or the history of medicine) is submitted to the candidate, on which he is required to write an extemporé essay.

The M Chir. degree may be granted to a candidate who has qualified for the B Chir. at least two years previously; he is then examined in pathology, surgery, surgical anatomy and surgical operations. The tests are partly in writing, partly oral, and partly practical, the latter including the writing of an extemporé essay.

Fees

In addition to college fees, tuition and examination fees are payable, the following examination fees being payable to the University: First M B., £3 5s.; Second M.B., £5 5.; Third M.B., £10 10s. For particulars referring to the examinations, lists of courses recognised for the various degrees, and for information as to application for admission to the University, Registrary, Cambridge.

UNIVERSITY OF LONDON

Under the regulations of the University of London degrees obtainable in the Faculty of Medicine are those of Bachelor of Medicine and Bachelor of Surgery (M B., B S.) in two parts, and Doctor of Medicine in different branches. The university has been granted the power of examination and has to appoint examiners and to confer degrees upon candidates found worthy by the boards related to it. The regulations for examinations in medicine are given in the calendar of the university, which may be obtained from the Registrar, University of London, South Kensington, S.W. 7.

It is held in January, June, and September, and lasts four days, the first two take place both in London and in certain provincial centres, the September examination is held in London only

In no circumstances is a degree granted to anyone in less than three years after the date at which he passed the Matriculation Examination or obtained registration in some other way, and, unless they are already registered medical practitioners of a certain age and standing, all medical students must pass not less than five and a half years in professional study subsequent to matriculation, of which the last three years must be spent at a school of advanced medical studies

PROFESSIONAL EXAMINATIONS

M B, B S—There are three examinations, the last two being subdivided They are held twice a year

The First Examination (held in July and December) covers inorganic chemistry, general biology, and physics, there being two papers, a practical test, and a possible oral test in each subject The names of successful candidates are placed in alphabetical order, with a note as to any subject in which a candidate has distinguished himself or herself

The Second Examination is held in March and July Part I cannot be passed within six months of the passing of the First Examination It covers organic and applied chemistry, the candidate's knowledge being tested as in the earlier examination It is a pass examination, but a mark of distinction may be won Candidates for Part II must have passed the First Examination at least eighteen months previously, besides having completed Part I of the Second Examination The subjects are anatomy, physiology, and pharmacology, the tests being written, oral, and practical Candidates who fail in one subject may sit for re-examination in that subject alone if the examiners think fit

No candidate is admitted to the third M B, B S Examination within three academic years from the date of his completing the Second Examination The subjects are medicine (including therapeutics and mental diseases), pathology, forensic medicine and hygiene, surgery, and midwifery and diseases of women They may be divided into two groups, one comprising medicine, pathology, forensic medicine, and hygiene, and the other surgery and midwifery and diseases of women Either group may be taken first at the option of the candidate, or the groups may be taken together Only candidates who show a complete final stage of the curriculum consisting a group of subjects case have to be held for the degree passed There is no separate examination divided honours, but the names of successful candidates are medal into in honours list and a pass list, and a university distinguished may be awarded the candidate who has most distinguished himself in the whole examination

THE HIGHER DEGREES

M D—An examination for the M D is held twice yearly in December and July Every candidate must have passed the examination for the M B B S, unless he became M B before May, 1904 He may present himself for examination in any one of the following branches (1) Medicine, (2) pathology, (3) mental diseases and psychology, (4) midwifery and diseases of women, (5) State medicine, (6) tropical medicine and, if he wishes, may pass also in another branch at a subsequent examination

The period that must elapse between acquiring the M B and sitting for the M D in any branch varies *between one* and two years, according to the nature of the candidate's previous work, and in all cases evidence must be afforded of special study of the subject chosen, both written and practical examinations must be passed, though exemptions can be obtained from the former in exceptional circumstances In each branch the scheme of examination is the same two papers on its special subject, a paper on an allied subject—for example, medicine in the case of branch (4) pathology in branch (1)—an essay on one of two suggested topics connected with the special subject, and a clinical or other practical test In any branch of the M D Examination a gold medal of the value of £20 may be awarded

M S—The regulations with regard to the Mastership in Surgery are of a corresponding kind, but there are only two branches in which it may be obtained—General Surgery and Dental Surgery

FEES

The examination fees have been raised from pounds to guineas for all examinations held after September 1st, 1918 For Matriculation 2 guineas for each entry First Examination 5 guineas for each entry to the whole examination For re-examination in one subject the fee is 2 guineas Second Examination, Part I 2 guineas for the first and each subsequent entry Second Examination, Part II 8 guineas for each entry to the whole examination For re-examination in one subject the fee is 4 guineas M B, B S Examination 10 guineas for each entry to the whole examination, and 5 guineas for examination or re-examination in either group M D and M S Examinations 20 guineas, and 10 guineas on re-examination

Inquiries should be addressed to the Registrar, the University of London, South Kensington, S W 7

UNIVERSITY OF BIRMINGHAM

THIS university confers the ordinary medical and surgical degrees—M B, Ch B, M D, and Ch M—and also diplomas and degrees in State medicine and dentistry It has a plan, too, by which, extending his study to six instead of five years, the M B, Ch B candidate may become a Bachelor in Science as well Of the five years' curriculum, the first four must be spent, as a rule, at the university itself, the fifth being passed at any approved school or schools Occasionally, however, the Senate will reduce the period of enforced residence to three years and exempt from the First M B (Part I) those who have passed elsewhere an examination considered to be its equivalent A degree of Ph D is also conferred for research study in medicine under special regulations Candidates must be graduates in medicine of a recognized university

Students entering the Medical Faculty for the M B, Ch B degrees must have passed—

(1) Either (*a*) the matriculation examination of the Joint Board of the Universities of Manchester, Liverpool, Leeds, Sheffield, and Birmingham, or (*b*) some other examination recognized as equivalent to the matriculation Candidates for medical degrees are recommended to take Latin and a science subject—chemistry or physics—at the matriculation examination, although these subjects are no longer compulsory The matriculation examination of the Joint Board is held in July and September The regulations and the list of examinations accepted in lieu thereof will be sent on application to the Secretary to the Board, Joint Matriculation Board, 315, Oxford Road, Manchester

(2) A recognized pre-medical examination in the subjects of chemistry and physics—for example, the Higher School Certificate of the Joint Matriculation Board, or a candidate may attend courses for pre-medical year in the university, October to June, taking chemistry and physics, and biology (optional)

PROFESSIONAL EXAMINATIONS

The candidate for the M B, Ch B degrees has five examinations to pass In the second and final examinations the candidate must pass in all the prescribed subjects or undergo the whole examination again

The First M B (Part I) deals with elementary biology, physical and organic chemistry The First M B course of instruction anatomy and physiology, and the candidate both simultaneously The Second (Part II) deals ister of pathology and] rmacology, materia student must Doctors of M ny , and M B the M B deals ngdom, they have obtained subjects be *medica*, and ard of the Faculty of Med place at th forensic me and special

TEACHING

colleges provide their unde for all examinations up to and diseases the university provides certa The candidate cluding lectures, demonstratio must be pre

post-mortem is counted by matriculation and b instruction college or a Hall or a non collegiate stud its commencin medical study after Decem diseases the thirty three month log of the certificat s that will be required from can the new Regulations of the General Medical Council Statutes Clarendon Press, Oxford, 1924 edition can be pr

gynaecological cases, and certificates drawn up by himself regarding four actual cases of lunacy and notes on two others

M D —An ordinary candidate for this degree must be a M B , Ch.B of not less than one year's standing He presents an original thesis for approval, and then passes a general examination in the principles and practice of medicine. From the latter the Board of Examiners may exempt a candidate whose thesis is of exceptional merit The regulations respecting the Ch M are of the same general character Subject to certain requirements as to special research or other post-graduate study, graduates of other universities may obtain the M D and Ch M in the same way as holders of the Birmingham M B , Ch B

FEE

The fee for matriculation is £2 £2 10s for pre medical examination (if taken in university) and £2 10s for each of the first four professional examinations M B , Ch B degree fee £10 M D and Ch M examinations £12 10s each For further particulars application should be made to the Dean of the Medical Faculty University of Birmingham

UNIVERSITY OF BRISTOL

In the Faculty of Medicine the following degrees are conferred Bachelor of Medicine and Bachelor of Surgery (M B and Ch B), Doctor of Medicine (M D), Master of Surgery (Ch M), Bachelor of Dental Surgery (B D S), and Master of Dental Surgery (M D S) There are also the following diplomas Diploma in public health (D P H), diploma in dental surgery (L D S), and diploma in veterinary state medicine All candidates for degrees in medicine, surgery, and dentistry are required to pass an examination called the School Certificate Examination, or to pass such examination as may be regarded as equivalent by the Senate All courses, degrees, and diplomas are open to men and women alike

Conjoined Degrees of Bachelor of Medicine and Bachelor of Surgery —Candidates must be not less than 21 years of age and have pursued the courses prescribed by university regulations during not less than five years after passing the first examination in chemistry and physics, of which three shall have been passed in the university, and two of these three subsequent to passing the second examination All candidates for the degrees of M B , Ch B are required to satisfy the examiners in the several subjects of three examinations

The First Examination —The subjects of examination are chemistry (inorganic), physics, and biology, the courses pursued being those for the time being approved for the intermediate part of the B Sc curriculum This part of the curriculum shall extend over one year (Candidates who have passed the Higher School Certificate approved by the Board of Education in these subjects will not be required to sit for the First Examination and will be regarded as having completed one year of study)

The Second Examination —The subjects of examination are organic chemistry and elementary anatomy (Part I) and advanced anatomy and physiology (Part II) Parts I and II may be passed separately or together

The Final Examination —The subjects of examination are materia medica and pharmacy, pharmacology and therapeutics, general pathology, morbid anatomy, and bacteriology (Part I), special pathology, forensic medicine, toxicology, and public health, obstetrics (including diseases of women), surgery (systematic, clinical, practical, and operative), medicine (systematic, clinical, and practical, including mental diseases) (Part II) The subjects included in Part II may be taken in two groups—namely, Group I surgery and obstetrics, Group II medicine, public health, special pathology, forensic medicine, and toxicology Candidates may pass Parts I and II together, or separately, and the two groups of Part II may likewise be taken together or separately Forensic medicine and toxicology may be taken either with Part I, or with Group II of Part II

Degree of Doctor of Medicine —Candidates must be Bachelors of the university of not less than two years' standing as such, and may elect either (1) to pass an examination in general medicine, or (2) to pass an examination in State medicine, or (3) to present a dissertation The candidate who elects to pass the examination in State medicine must hold a Diploma in Public Health of some university or college, and the candidate who elects to present a dissertation may be examined in the subject thereof

Degree of Master of Surgery —Candidates shall be Bachelors of not less than two years' standing as such, during which period they shall have attended the surgical practice of an institution approved for the purpose They shall pass an examination in surgical anatomy, pathology, and bacteriology, and operative, clinical, and general surgery, and present to the university a dissertation on some subject of surgery The degree may be taken also in general surgery, and a special subject—for example, oto-rhino-laryngology, ophthalmology, and gynaecology

Diploma in Public Health —Candidates must be at least 23 years of age, be fully registered medical practitioners of not less than two years' standing as such, and have passed the examination prescribed by regulation The examination is divided into two parts.

UNIVERSITY OF DURHAM

To its own undergraduates, who may be of either sex, this university grants the degrees of Bachelor of Medicine and Bachelor of Surgery (M B , B S) and Doctor of Medicine (M D), Master of Surgery and Doctor of Surgery (M S and D Ch), and Bachelor of Dental Surgery and Master of Dental Surgery (B D S and M D S), it also grants special degrees and diplomas in public health, psychiatry, and dental surgery The university accepts the Durham University School Certificate Examination (if the required subjects are passed with credit) for matriculation purposes, but also accepts the tests of a considerable number of other educational bodies as a full or partial equivalent A list may be obtained on application In addition to satisfying the matriculation requirements of the university, every student must (1) pass a pre-registration examination in physics and inorganic chemistry conducted or recognized by the university, and (2) be registered on the books of the General Medical Council To become a graduate, however, at the university it is not necessary to pass the major portion of the five years' curriculum within its precincts It is sufficient if, before he presents himself for his final examination, the candidate has passed at least one year in study at the University of Durham College of Medicine, Newcastle upon-Tyne, including the practice of the Royal Victoria Infirmary in the same city The earlier examinations may be passed while the student works elsewhere

PROFESSIONAL EXAMINATIONS

There are four professional examinations for the M B , B S degrees Each is held twice a year—in June and December The first deals with biology, chemistry, and organics, the second with anatomy and physiology, the third with pathology, bacteriology, medical jurisprudence public health, materia medica, and pharmacy At the final M B , B S , the candidate is examined in medicine and clinical medicine, surgery and clinical surgery, midwifery and diseases of women and children, clinical and practical gynaecology, therapeutics, and clinically in psychological medicine, diseases of the throat nose, and ear, diseases of the skin, diseases of the eye, and diseases of children

M D —A Bachelor of Medicine who wishes to proceed to this higher degree must be of at least two years' standing, and must comply with the regulations printed in the Calendar of the College of Medicine If the candidate is not a M B of the university he must be a practitioner of fifteen years' standing, 40 years of age, and submit to special tests (See under Degrees for Practitioners, p 433)

M S —Candidates for this degree must have been engaged in practice for at least two years subsequent to becoming M B B S Durham They are submitted to an examination which covers the whole range of surgical knowledge

D Ch —The university grants also the degree of Doctor of Surgery Candidates for this degree must be registered medical practitioners, not less than 24 years of age They

must devote three years, subsequent to obtaining a registrable qualification, to the study of surgery and ancillary subjects, one at least of the three years must be spent in the university The candidate must submit to the professor of surgery the course of study he proposes to follow, and this course must be approved by the Board of the Faculty of Medicine

One year shall be devoted mainly to work in the departments of anatomy, physiology, pathology, and bacteriology, and the candidate must submit evidence of having so worked Not less than six months of another year must be spent as resident surgeon in a recognized teaching hospital, and the rest of the year in the study of surgery in a recognized medical centre Not less than six months of one of the three years must be spent in surgical study abroad

Regulations for Degree of Bachelor of Hygiene and the D P H

1 No candidate is admitted to the final examination for the degree of B Hy unless he is a Bachelor of Medicine and Surgery, of not than two years' standing, of a recognized university

2 No candidate is admitted to the final examinaion for the D P H unless he is a registered medical practitioner, of not less than two years' standing

3 The course of study for the B Hy and D P H shall extend over a period of not less than twelve calendar months, subsequent to the attainment of a registrable qualification Candidates for the B Hy must attend this course at the University of Durham, candidates for the D P H may attend it at the University of Durham or at any medical school or institution which is recognized by the university

4 The examination for the diploma or degree shall be divided into two parts Part I and Part II, each of which shall extend over not less than two days, and shall be conducted by examiners specially qualified A candidate must pass in all the subjects of Part I before being admitted to examination for Part II In Part I, and also in Part II, a candidate must pass in all the specified subjects at one time

5 The examination for Part I shall be practical, written, and oral, and shall include the following subjects bacteriology and parasitology (including medical entomology), chemistry and physics and meteorology and climatology, in relation to public health Candidates may not be admitted to examination for Part I until after they have completed the prescribed courses of instruction in the subjects thereof

6 The examination for Part II shall include the following subjects hygiene and sanitation (including sanitary construction) epidemiology and infectious diseases, sanitary law and vital statistics, public health administration The examination shall be written and oral, and shall include practical examinations in infectious diseases, food inspection inspection of premises—dwellings, factories, workshops schools, etc Candidates may not be admitted to examination for Part II until after they have completed the prescribed courses of instruction in the subjects thereof

The fee for the examination for the degree of B Hy is £10 10s, and for the degree £6 6s

Candidates for the degree of Doctor of Hygiene (D Hy) shall be Bachelors of Hygiene of two years standing, and shall be required to satisfy the examiners that they have conducted original research in the subject of public health The fee for the examination for the degree of D Hy is £20, and for the degree £10 The fee for examination for the diploma in public health is £10 10s, and for the diploma £3

FEES

The following fees are payable Matriculation or its equivalent, £2, First Second, and Third M B, B S Examinations, each £5, Final M B, B S, £15, M D and M S, £5 for each examination and £12 12s for the degrees of M B and B S The fee for the degree of M D is £10 The fee for the examination of D Ch is £20, and the fee for the degree £10

Further information may be obtained from Professor Howden, Registrar, University of Durham College of Medicine, Newcastle-upon-Tyne

UNIVERSITY OF LEEDS

THE degrees granted in the Medical Faculty of this university are Bachelor of Medicine, Bachelor of Surgery (M B and Ch B), and Bachelor of Dental Surgery (B Ch D) Doctor of Medicine (M D), Master of Surgery (Ch M), and Master of Dental Surgery (M Ch D) It also gives diplomas in public health, in psychology, in dental surgery, and in nursing

Candidates for the M B must have attended courses of instruction approved by the university for not less than five years, two at least of such years having been passed in the university, at least one year being subsequent to the date of passing the first examination They must also have matriculated by satisfying the examiners in

I *Either* English Composition and English Literature, *or* English Composition and History
II *Either* Mathematics *or* Latin
III, IV, V *Three* other subjects not already taken under I and II above, chosen from the following list

1 English Literature	9 Mathematics
2 History	10 Mechanics
3 Geography	11 Physics
	12 Chemistry
4 Greek	13 General Experimental
5 Latin	Science
6 French	14 Natural History
7 German	15 Botany

8 Some one other language approved by the Board

Provided that (*a*) candidates who take Mathematics under II above must include one of the subjects 4—8, (*b*) candidates who take Latin under II above must include one of the subjects 9—15

Exemption from the examination may be granted to applicants holding certificates of having passed examinations of a standard deemed by the Matriculation Board to be at least equal to the Board's examination

PROFESSIONAL EXAMINATIONS

The examinations for the M B, Ch B number three The first deals with (1) physics and chemistry, (2) biology In each subject laboratory work is included, but the two parts can be taken separately For neither can the candidate present himself until after matriculation and a period of approved work in the respective subjects

Second M B—This examination may be taken in two parts (*a*) anatomy and physiology, including practical work, (*b*) materia medica and pharmacy, including actual compounding of drugs The candidate's certificates must show, among other things, that he has dissected during at least five terms

Final M B—This may be divided into three parts The first (pathology and bacteriology) may be taken at the end of the tenth term, the second (forensic medicine and public health) and the third (medicine, surgery, obstetrics, and pharmacology and therapeutics) cannot be taken before the end of the fifth year, before admission to the examination in its subjects the candidate, besides ordinary certificates, must produce proof that he has done both interne and externe maternity work, and received clinical instruction in gynecology in diseases of the eye, skin, or larynx, and in the administration of anæsthetics This division covers all branches of surgery, medicine (including mental diseases and diseases of children), and obstetrics and gynæcology First and second class honours may be obtained in this division

The regulations and curriculum are now under revision in accordance with recent recommendations of the General Medical Council

M D—A candidate for this degree must be a M B, Ch B of the university of at least one year's standing He presents a dissertation embodying the results of personal observation or original research, and, if this is approved, he may be required to write a short extempore essay on some topic connected with medicine, and may be examined orally on the dissertation or other work submitted

Ch M—The candidate for this degree must have been admitted to the M B, Ch B of the university not less than a year previously, and during that time must have held for at least six months a surgical appointment in a public institution affording full opportunity for the study of practical surgery He must also have attended certain courses, including one on ophthalmology and one on bacteriology, he is then examined on the subject of surgery in all its branches

FEES

The matriculation fee is £2, and on readmission £1 10 For each of the other examinations £6 (£7 for Ch M) and £3 on readmission On conferment of the degree of Ch M £7 is payable, and £6 for the M D degree

UNIVERSITY OF LIVERPOOL

THIS university, besides granting degrees in medicine (M B and M D) and in surgery (Ch B, M Ch Orth, and Ch M) gives degrees in dental surgery (B D S and M D S), a degree in hygiene (M H), and degrees in veterinary science (B V Sc, M V Sc, and D V Sc) Diplomas are awarded in dental surgery (L D S), tropical medicine (D T M), public health (D P H), veterinary hygiene (D V H), and medical radiology and electrology (D M R E)

MATRICULATION

The Matriculation Examination is governed by the Joint Matriculation Board, 315, Oxford Road, Manchester, which accepts, under certain conditions, the tests of several other bodies as its equivalent Chemistry and physics are essential pre registration subjects

PROFESSIONAL EXAMINATIONS

Candidates for the M B, Ch B degrees have three examinations to pass, the first including (1) chemistry, (2) physics, (3) biology (zoology and botany)

Second M B—This test covers (*a*) (1) anatomy, (2) physiology, including physiological chemistry and histology, and (*b*) (3) elementary bacteriology, (4) clinical chemistry, (5) general pathology Candidates may present themselves in (*a*) and (*b*) separately

Final M B—The subjects of the Final Examination are (*a*) (1) special pathology and morbid anatomy, (2) forensic medicine and toxicology, (3) public health, (4) pharmacology and general therapeutics, (*b*) (5) obstetrics and diseases of women, clinical, operative, and practical— (7) medicine—systematic and clinical, (8) therapeutics, mental diseases, and diseases of children Candidates may take Parts (*a*) and (*b*) separately, but Part (*b*) may not be taken until five years of study have been completed

M D and Ch M—Candidates for these degrees must have received the M B and Ch B at least two years previously Students holding equivalent degrees of other approved universities may become candidates for the M D degree after two years study in the university or clinical school of the university The M D candidate submits for approval a thesis covering original work in some branch of medicine or some science directly relative to medicine, together with, if desired, copies of published work The M Ch candidate undergoes an examination Other information concerning the diplomas of this university and its medical school will be found on page 426

FELLOWSHIPS SCHOLARSHIPS AND EXHIBITIONS

The university awards Fellowships annually to students of distinguished merit as follows

(1) John Rankin Fellowships in Anatomy two each of the value of £120 tenable for two years (2) Ethel Bovce Fellowship in Gynaecology value £100 and tenable for one year open to fully qualified medical students of either sex (3) John W Garrett International Fellowship in Bacteriology value £100 and tenable for one year (4) Robert Gee Fellowship in Human Anatomy value £100 and tenable for one year (5) Holt Fellowships in Physiology and Pathology two in number value £150 each and tenable for one year (6) John ton Colonial Fellowship in Bionable for one year (7) Thelwall Pathology value £150 and tenable Fellowship £100 (9) Lady Jones gery one value £200 offered every two years

There are in addition scholarships and exhibitions open to medical students

VICTORIA UNIVERSITY OF MANCHESTER

THIS university grants the four ordinary degrees in medicine and surgery—M B and Ch B and M D and Ch M a degree and diploma in dental surgery, a diploma in public health, a certificate in factory and in school hygiene a diploma in psychological medicine, and a diploma in bacteriology Candidates for degrees must pass the special Matriculation Examination prescribed by the Faculty of Medicine (or some equivalent examination accepted in lieu thereof, see the prospectus of the Joint Matriculation Board), and study at the university itself for at least two years of the six years' curriculum, subsequent to the passing of the first M B Examination The Matriculation Examination comprises (1) Latin (2) mathematics, (3) the English language, its literature and history, (4) mechanics, (5) two subjects at choice as approved by the Joint Board It is held in July and September

PROFESSIONAL EXAMINATIONS

M B, Ch B—There are four examinations for this degree They must be passed in proper order, and before admission to them the candidate must be duly certified as having attended in the subjects involved The first M B is divided into Part 1, chemistry and physics, Part 2, biology—(*a*) botany, (*b*) zoology The parts may be taken separately or together At the second M B the candidate is examined in anatomy (including histology) and physiology, at the third, in pathology and pharmacology (including materia medica and practical pharmacy The Final Examination is divided into two parts, which may be taken separately, and includes medicine (systematic and clinical), mental diseases, and diseases of children, surgery (systematic, clinical, and practical), obstetrics and gynaecology, preventive medicine, forensic medicine, and toxicology

M D—A candidate for this degree must be a bachelor of medicine of at least one year's standing He has a choice between presenting an original dissertation or undergoing a written (as well as practical and clinical) examination in medicine, and a written and practical examination in pathology, and one other subject selected by himself

Ch M—A candidate must have held, since becoming Ch B, and for not less than twelve months, a post in a public institution affording opportunity for the study of the branch of surgery in which examination is desired The examination in Branch I comprises the general field of surgery, Branch II, obstetrics and gynaecology, Branch III, ophthalmology, Branch IV, otology, laryngology, and rhinology

FEES

The following examinations Matriculation £2 on readmission £1 10s admission £3 3s M D £3 8 on re of the degree £15 15s Ch M £6 6s for examination 3 9 for conferment of degree Application for further information should be addressed to the Dean of the Medical Faculty

UNIVERSITY OF SHEFFIELD

THE degrees of this university (M B, Ch B, M D and Ch M, B D S and M D S), the diploma in public health, and the diploma of licentiate in dental surgery, are open to candidates of either sex Candidates for a degree must have matriculated in the university or have passed such other examination as may be recognized for this purpose and have passed the further examination in chemistry and physics

PROFESSIONAL EXAMINATIONS

A candidate for the degree of M B Ch B must produce certificates that he will have attained the age of 22 years by the day of graduation, that he has pursued the courses of study required by the university regulations during not less than five years subsequent to the date of his matriculation or exemption from matriculation, and the passing of the further examination in chemistry and physics, three of such years at least having been passed in the university, one at least being subsequent to the passing of the first examination The following examinations must be passed in due order

First Examination—The subjects are chemistry, physics and biology The intermediate examination in science—chemistry, physics, and zoology—will, on payment of the required additional fee, be accepted instead of this examination Candidates on presenting themselves for this examination are required to furnish certificates of having attended for not less than one year approved courses of instruction, after matriculation and the passing of the further examination in physics and chemistry, in (i) chemistry, inorganic and organic (ii) physics, (iii) biology

Second Examination—The subjects are anatomy and physiology The candidate must have completed the second year of professional study, must have passed the First Examination, and must have attended (1) lectures on anatomy and dissections during three terms (2) lectures on practical experimental, and chemical physiology and histology during three terms

Third Examination.—The subjects are pathology and pharmacology, anatomy and physiology. Candidates must have completed the fourth winter of medical study and the requisite courses in these subjects, including *post-mortem* clerkship for three months.

Final Examination.—The subjects are—Part I, forensic medicine and public health, Part II, medicine (including mental diseases and diseases of children), surgery, obstetrics (including gynaecology). Candidates must have completed the fifth year of study.

M D.—Candidates for the degree of Doctor of Medicine must have passed the examination for the degrees of M B, Ch B at least one year previously, must present a thesis embodying observations in some subject approved by the Professor of Medicine, and must pass an examination in the principles and practice of medicine.

Ch M.—Candidates for the degree of Master in Surgery must have passed the examination for the degrees of M B, Ch B at least one year previously, and must, since taking the degrees of M B, Ch B, have held for not less than six months a surgical appointment in a public hospital or other public institution affording full opportunity for the study of practical surgery. The subjects of examination are systematic, clinical, and operative surgery, surgical anatomy, surgical pathology, and bacteriology.

Other information concerning this university will be found in the section devoted to Provincial Medical Schools.

UNIVERSITY OF WALES

THE Charter and statutes of the University of Wales provide *inter alia* for a Faculty of Medicine and for the granting of the following degrees: Bachelor in Medicine (M B), Bachelor in Surgery (B Ch), Master in Surgery (B Ch), and Doctor in Medicine (M D).

A candidate for the M B, B Ch is required to pursue a course of study of not less than six academic years subsequent to matriculation in the university, and of these years at least three must have been passed as a student in one of the constituent colleges of the university. These are the University College of Wales, Aberystwyth, University College of Wales, Bangor, University College of South Wales and Monmouthshire, Cardiff, and University College, Swansea. He must also hold an Arts or Science degree of the University of Wales, or of some other university approved for this purpose. Certain of the courses of study pursued for a B Sc or B A degree may be counted as part of the courses required for the degrees in the Medical Faculty.

The courses for the M B, B Ch are divided into two sections, of which the first includes the preliminary subjects—physics, chemistry, botany, zoology, and the ancillary subjects—organic chemistry, human anatomy, and physiology. Study of the preliminary subjects and of organic chemistry must extend over at least one academic year, study of physiology and anatomy must extend over at least two academic years, and cannot be commenced until all the preliminary courses have been completed, hence the first section of the course must occupy not less than three years. The second section includes courses in pathology, bacteriology, pharmacology, medicine, surgery, and obstetrics and gynaecology, and cannot be commenced, except in the case of pharmacology, until the examinations relating to the preliminary and ancillary courses have been passed. Examinations in the earlier subjects are held at the end of each academic year, and in the subjects of the second section each July.

The university also offers courses of study in public health and in tuberculosis. Candidates for the Diploma in Public Health (D P H) and for the Tuberculous Diseases Diploma (T D D) must possess a medical qualification registrable for practice in Great Britain and Ireland, and must have completed courses of study as prescribed by the regulations either at the Welsh National School of Medicine, Cardiff, or at another institution approved by the university.

WELSH NATIONAL SCHOOL OF MEDICINE

Students can complete the whole of their curriculum in the Welsh National School of Medicine, which is an integral part of the University College of South Wales and Monmouthshire, and qualify for the degrees of M B, Ch B in the university.

Further information may be obtained from the Registrar, the University Registry, Cathays Park, Cardiff.

English Medical Corporations.

THERE are three medical corporations in England—the Royal College of Physicians of London, the Royal College of Surgeons of England, and the Society of Apothecaries of London. The first two combine for certain purposes to form what is known as the Conjoint Board in England. Details concerning this body, its component Colleges, and the third licensing body here follow.

THE CONJOINT BOARD

THIS body—the Examining Board in England—deals with the qualifications of all candidates for the Licence of the Royal College of Physicians of London and for the Membership of the Royal College of Surgeons of England. It prescribes for them certain periods of study, and recommends those who pass the required examinations for the Licence and for the diploma of Member respectively. The successful candidate is then entitled to register as L R C P Lond, M R C S Eng. It performs the same task in connexion with diplomas in State medicine, tropical diseases, ophthalmic medicine and surgery, psychological medicine, and laryngology and otology—jointly issued by the two Colleges in question. Under the new regulations, which apply to all students who have not passed the required preliminary tests of general education before January 1st, 1923, every candidate for the M R C S and L R C P must (1) complete five years of professional study after passing a recognized preliminary examination and a recognized pre-medical examination in chemistry and physics, (2) comply with the regulations, which may be had from the Secretary, Examination Hall, 8-11, Queen Square, Bloomsbury, London, W C 1, and (3) pass the two professional examinations of which particulars appear below. The old regulations for the Conjoint diploma, of which an account was given in the *Educational Number* for 1922, still apply to students who passed their preliminary examination in general education before January 1st, 1923.

NEW REGULATIONS FOR THE CONJOINT DIPLOMA

The following is an outline of the regulations applicable to candidates for the L R C P Lond. and M R C S Eng., who passed the required Preliminary Examination in general education on or after January 1st, 1923. The full regulations and synopses and forms of certificate may be obtained from the secretary.

PRE-MEDICAL EXAMINATION

Students are required to pass a Pre-Medical examination in Chemis[try] by the Conjoint Examining Board before [stu]dents' curriculum of professional study or some [rec]ognized by the Board—namely, the examination in Chemistry and Physics for the degree in Medicine of any university recognized by the Board, the Higher School Certificates of Oxford and Cambridge Universities and the Oxford and Cambridge Schools Examination Board, the Higher Certificates of London, Bristol, Durham Universities, and the Joint Matriculation Board of the Northern Universities, and the Central Welsh Board Higher Certificate.

A candidate must enter for Chemistry and Physics together and he will not be allowed to pass in one without obtaining at the same time at least half the number of marks required to pass in the other subject. He will be admitted to the examination on producing evidence of having passed the required Preliminary Examination in General Education and of having received instruction during 120 hours in Chemistry and 120 hours in Physics to the satisfaction of his teachers. These courses may be commenced or attended before the required Preliminary Examination in General Education is passed.

The examination is partly written, partly oral and partly practical. A candidate rejected in one or both subjects of the examination will not be admitted to re-examination until after the lapse of a period of not less than three months and he must produce evidence of further instruction in the subject or subjects of failure.

PROFESSIONAL EXAMINATIONS

There are two Professional Examinations, called the First and Final Examinations. The courses of study for these examinations

must not be commenced until the Pre Medical Examination in Chemistry and Physics or some equivalent examination has been passed

First Professional Examination—The subjects of this are Section I (*a*) Anatomy including Histology and Embryology (*b*) Physiology including Biochemistry Section II Pharmacology Practical Pharmacy and Materia Medica A candidate must have Medical School courses of instruction in ryology during five terms during which the truction in ener and Bio- co rmacology- d Materia Medica A candidate may present himself for the two Sections together or separately, but he must take parts (*a*) and (*b*) of Section I together until he has passed in one or both parts but a candidate will not be allowed to pass in one part unless he obtains at the same time at least half the number of marks required to pass in the other part Section II of the examination may be passed at any time before the candidate enters for the Final Professional Examination A candidate who produces satisfactory evidence of having passed an examination in the subjects of Section I or of either part of Section I and of Section II in the examination for the degree in Medicine conducted at a university recognized by the Board will be exempted from further examination in such subject or subjects

Final Professional Examination—The subjects of this are Section Morbid Anatomy Morbid Hi tology Bacteriology Section II Part I natomy Forensic Medicine and Pub including Surgical Anatomy and the Part III Midwifery and Gynaecol ly written partly practical partly clinical and partly oral A candidate may take Sections I and II and the three parts of Section II of the Final Examination separately or may take the whole examination together He will be required to produce the certificates required by the regulation before being admitted to the respective parts of the examination A candidate who produces evidence of having passed an examination for a degree in Medicine in the subjects of Pathology and Bacteriology at a university recognized by the Board is exempted from Section I

FEES

The fee for the *Pre Medical Examination* is three guineas for re examination in Chemistry two guineas and for re-examination in Physics one guinea The fee for the *First Professional Examination* is ten guineas for re-examination after rejection in Section I six guineas for re-examination after rejection in either part of Section I three guineas for re-examination after rejection in Section II three guineas The fee for admission to Section I of the *Final Professional Examination* is four guineas for admission to Section II Part I ten guineas Part II ten guineas Part III six guineas and the re-examination fees are respectively three guineas six guineas and four guineas

ROYAL COLLEGE OF PHYSICIANS OF LONDON

THIS College has three grades—its Licentiates, its Members and its Fellows The Licence is now only issued through the Conjoint Board The Membership is only granted to those who have passed the final examinations for the Licence or those who are registered practitioners and graduates of a recognized university, in any case they must be persons over 25 years of age Candidates are examined in pathology and the practice of physic, partly in writing and partly viva voce, they are also examined in Latin, Greek, French, and German The languages are not compulsory, but credit is given to those who show a knowledge of them The fee for the Membership is £12, or in the case of a Licentiate £21 There is a fee of £6 6s, payable before entrance to the examination which in the case of successful candidates is reckoned as part of the Membership fee The body of Fellows is maintained by election from among the Members

ROYAL COLLEGE OF SURGEONS OF ENGLAND

THIS College has two grades—Members and Fellows The Members are admitted as stated in the section dealing with the Conjoint Board The Fellowship is granted after examination to persons at least 25 years of age who have been engaged in professional studies for six years There are two examinations for the Fellowship—the first in anatomy and physiology which may be passed after the third winter session, the second chiefly directed to surgery which may be passed after six years of professional study Candidates must pass the Final Examination of the Examining Board in England and be admitted Members of the College before admission to the Second Examination for the Fellowship except in the case of graduates in medicine and surgery of not less than four years' standing of universities recognized by the College for the purpose who are required to attend for one year the surgical practice of a general hospital recognized by the College after obtaining their degrees

Fees—At first examination £8 8 for re-examination £5 5 At second examination £12 12s Diploma fee for non members, £10 10s

SOCIETY OF APOTHECARIES OF LONDON

THIS body confers a registrable diploma in medicine, surgery, and midwifery, now known as the L M S A (Licentiate in Medicine and Surgery of the Society of Apothecaries), on those successful at the following examinations

Primary Examination—This is divided into two parts, of which Part I includes chemistry, chemical physics practical chemistry, biology, and pharmacy Part II includes anatomy, physiology, and histology, and cannot be passed before the completion of twelve months' practical anatomy with demonstrations Candidates will be excused any or all the subjects of the primary examination on producing evidence that they have passed equivalent examinations before an examining body recognized by the Society Candidates referred in anatomy will be required to produce evidence of further work in the dissecting room before being admitted to re-examination

Final Examination—This is divided into three parts Part I includes clinical surgery, the principles and practice of surgery surgical pathology, operative manipulation surgical anatomy instruments and appliances Part II includes clinical medicine (*a*) The principles and practice of medicine (including therapeutics pharmacology, and prescriptions) pathology and morbid histology, (*b*) forensic medicine hygiene theory and practice of vaccination, and mental diseases Part III includes midwifery, gynaecology, and diseases of new-born children, obstetric instruments and appliances

The fee for the primary examination is £5 5s for the final, £15 15s The regulations and syllabuses relating to the several examinations and other information, may be obtained from the Secretary, Court of Examiners, Apothecaries' Hall, Blackfriars, E C 4

The Scottish Universities.

THERE are in Scotland four universities, each possessing a faculty of medicine and having the right to confer degrees which admit the holder to the *Medical Register* In essential points the regulations in their medical faculties for undergraduates are much alike, so that a general account can be given of all of them together

The universities are those of Edinburgh Glasgow, Aberdeen, and St Andrews The provision each of the cities in which these universities are situated makes for the education of medical students will be found in the section on Medical Schools in Scotland, here it need merely be said that degrees in medicine from Scotland as a whole have always enjoyed a high repute

The degrees granted in medicine and surgery to candidates of either sex are four in number—Bachelor of Medicine (M B), Bachelor of Surgery (Ch B), Doctor of Medicine (M D), Master of Surgery (Ch M) The two former are not obtainable one apart from the other Besides these degrees a diploma in tropical medicine and hygiene is obtainable from the University of Edinburgh as also diplomas in psychiatry and public health As for public health, registrable degrees in this subject are granted by the Universities of Edinburgh and Glasgow, while diplomas in public health may be obtained from the Universities of St Andrews and Aberdeen

The conditions for admission of graduating students of medicine are the same as those in the Faculties of Arts or Science (for degrees in pure science)

As from January 1st, 1923, prospective medical students are also required to pass a pre-registration examination in chemistry and physics

PROFESSIONAL EDUCATION

The regulations comply in all respects with the requirements and recommendations of the General Medical Council, and in addition necessitate definite study for stated periods of diseases of children, of the larynx, ear and nose, of the skin, of ophthalmology, and of mental diseases In respect of the various courses certificates must be obtained showing that the student has not only attended regularly, but has duly performed the work of the class Out of the necessary five years of medical study, not less than two must be spent at the university whose degrees the student hopes to obtain, and the balance at any place officially recognized for such purpose In each academic year there are two sessions—one lasting from the beginning of October to the middle of March, and the other from the beginning of May to the middle of July

PROFESSIONAL EXAMINATIONS

The distinctive feature of the Scottish curriculum is that, though nominally there are only four examinations, each of these may be, and habitually is, split up by the student into sections Hence, a student may complete some stage of his career during the course of nearly every session Thus, by the end of the first winter session the student may pass in zoology and chemistry At the end of the first summer session he can finish with botany and physics, and with anatomy and physiology at the end of the second Pathology and materia medica he will pass at the end of the third year, and so on, until the final examination in midwifery, surgery, and medicine, and the corresponding clinical subjects, at the end of the fifth year of study At each examination the candidate may pass "with distinction," and a record is kept of the merit displayed, so that, when the time comes for the candidate to graduate, one who has done well throughout can be declared as graduating with first or second class honours A further point in the system is that the student's own teachers commonly take some part in his examination

Of the four examinations, the first deals with physics, botany, zoology, and chemistry, the second with anatomy and physiology, the third with materia medica and pathology, the fourth with medicine and surgery (clinical and systematic), midwifery, clinical midwifery, and clinical gynaecology, and forensic medicine and public health The first three examinations are held three times a year, the final twice a year

Exemption from the first professional examination can be obtained by candidates who have passed an arts or science degree examination in its subjects at any recognized university When a candidate presents himself for an examination in several of its parts, but is not successful in all of them, he is credited at the next examination with those subjects in which he has already been approved

THE HIGHER DEGREES

It is open to those who are already M B, Ch B to proceed either to the M D or the Ch M A candidate for the former must have been engaged for not less than one year in work in the medical wards of a hospital, or in scientific research in a recognized laboratory, or in the Naval or Military Medical Services, or have been at least two years in general practice, and he must be 24 years of age He has to write a thesis on any subject not exclusively surgical, and is examined in clinical medicine and in some one or other of its special departments The regulations for candidates for the Ch M are of a corresponding character, a period of surgical work in a hospital or elsewhere being substituted for medical work, and the thesis being on a surgical rather than a medical subject He is examined in surgical anatomy, clinical surgery, operative surgery, and in some of the special departments of surgery

FEES

It is estimated that the class examination, and other fees for the M B, Ch B come altogether to about £247, the separate examination fees included in this calculation being as follows

	£ s d
First Professional	9 9 0
Second Professional	7 7 0
Third Professional	6 6 0
Final	11 11 0

Re entry in any subject in which the candidate has failed entails a fresh payment of £1 1s Candidates for the M D and Ch M pay £21, and on re entry £5 5s

More detailed information with regard to the University of Edinburgh can be obtained from the *Medical Programme*, price 6d, which is published by Mr Thin, 55, South Bridge, Edinburgh, or on application to the Dean of the Faculty of Medicine Similar information about Glasgow should be sought from the Assistant Clerk, Matriculation Office, Glasgow With regard to Aberdeen, application may be made to the Secretary of the Medical Faculty, Marischal College In respect of St Andrews information can be obtained either from the Secretary of the University, or, alternatively, the Secretary of the United College, St Andrews, or the Secretary of University College, Dundee, these being the two constituent colleges of the University of St Andrews

Finally it should be mentioned that in connexion with all the Scottish universities there are valuable bursaries and scholarships, some information as to which will be found in the article on Medical Schools

THE CARNEGIE TRUST

The following is a summary of the regulations made by the Carnegie Trust for the Universities of Scotland for assistance in the payment of class fees in the universities and extramural colleges of Scotland

Applicants must be over 16 years of age, they must be of Scottish birth or extraction, or have attended for two years, after the age of 14, at a school or institution under inspection of the Scottish Education Department Applicants so qualified who have been pupils of schools under the Scottish Education Department will be eligible for assistance in the payment of class fees if they have obtained the leaving certificate of the Department, provided that it bears evidence of such preliminary education as is required by the universities for their graduating curricula, or that it has been supplemented by such passes either in the Scottish Universities Preliminary or other examination as will satisfy the above requirement of the universities Where applicants have not been pupils of schools under the Scottish Education Department, or where other good ground for not having obtained the leaving certificate can be shown, the Executive Committee has power to accept instead what it deems equivalent evidence of attainments

Applicants in the Faculties of Arts and Science must have had their course of study for each academic year approved by the University Adviser of Studies, and they must have passed the graduation examinations belonging to the previous stage of their curriculum before becoming eligible for assistance in the payment of fees of classes belonging to a further stage Beneficiaries must submit to the Executive Committee at the end of each session particulars as to their attendance and work, any distinctions gained, and any graduation examinations passed

The annual allowance towards payment of class fees offered to beneficiaries by the Trust in the Faculty of Medicine is £20 for four years, in all £80 Any unexpended part of a grant will be carried forward to the succeeding year In combinations of Faculties the allowances available for beneficiaries are Arts and Medicine two Arts grants of £9 and four Medicine grants of £20, in all £98, Science and Medicine two Science grants of £18 and four Medicine grants of £20, in all £116

Applicants, in writing for application forms, must name the university and faculty in which they intend to study, and state whether they have previously obtained the benefits of the Trust Applications must be lodged not later than October 25th for the winter session, or May 10th for the summer session Payments are made by means of fee coupons, and fees already paid are not refunded

The Scottish Corporations.

THERE are three medical corporations in Scotland—the Royal College of Physicians of Edinburgh, the Royal College of Surgeons of Edinburgh, and the Royal Faculty of Physicians and Surgeons of Glasgow Their licences can be separately obtained only by persons who are already in possession of a recognized qualification—in surgery in the case of the College of Physicians, and in medicine in the case of the College of Surgeons and the Faculty of Physicians and Surgeons of Glasgow All others must submit to the examinations held by the Conjoint Board which the three corporations have combined to form Details concerning this Board and its component colleges follow The conditions on which their higher qualifications are granted will be found set forth separately in connexion with each corporation

THE CONJOINT BOARD IN SCOTLAND

This body has charge of all questions connected with candidates for the Conjoint Licences of the Royal College of Physicians of Edinburgh, the Royal College of Surgeons of Edinburgh, and the Royal Faculty of Physicians and Surgeons of Glasgow. Those finally approved by it are entitled to registration and to the initials denoting the Licences of the three bodies concerned—namely, I.R.C.P. Edin., L.R.C.S. Edin., and L.R.F.P.S. Glas. The Board requires all candidates to comply with the regulations of the General Medical Council. It has an arts examination of its own, but is prepared to accept in its place any of the other educational tests approved by the General Medical Council. All candidates must obtain registration with the General Medical Council.

Professional Curriculum for Candidates registered as Medical Students prior to January 1st, 1923.

Subsequent to registration as a medical student the candidate must pass not less than five years in medical study, each comprising a winter and a summer session. The Board does not insist that candidates shall pursue their study at any particular place, and is prepared to accept certificates of having attended the necessary courses from any recognized medical school.

Its examinations are four in number, each of them being held four times every year, and these will fall to be held twice in Edinburgh and twice in Glasgow during the next period. It is open to candidates to present themselves for examination at either place. The first examination deals with physics, chemistry, and elementary biology, the second with anatomy and physiology, including histology, the third with pathology and materia medica, including pharmacy, and the final with (1) medicine, including therapeutics, medical anatomy, and clinical medicine, (2) surgery, including surgical anatomy, clinical surgery, and diseases and injuries of the eyes, (3) midwifery and diseases of women and of newborn children, and if it has not been passed previously, (4) medical jurisprudence and hygiene. Candidates may also be examined on diseases of children, diseases of the ear and throat, insanity, vaccination, etc.

These examinations must be passed in due order, and before admission to any of them the candidate must supply certificates showing that he has completed the due periods of study of their subjects. He can present himself in any single subject of the first three examinations. As regards the final examination, a candidate can present himself in medical jurisprudence and hygiene at any time after completion of the third examination and of his study of these subjects, but in medicine, surgery, and midwifery he cannot present himself until the completion of five years' study, and he must take them all simultaneously. A candidate who takes up several subjects of an examination or the whole of the subjects at one time, but fails in some of them, is credited at the next examination with those subjects in which he has been approved.

Part or entire exemption from the first three examinations may be granted to those who have already passed before other bodies examinations deemed by the Board equivalent to its own, but all candidates for the Conjoint licence must sit for the final examination, and at no examination can a candidate present himself within three months of his rejection by some other licensing body.

Professional Curriculum for Candidates registered as Medical Students after January 1st 1923.

The curriculum has been extended to meet the recommendations of the General Medical Council. Candidates when applying for copies of regulations should state date of medical registration.

FEES

It is estimated that the total cost of lectures and fees for the Conjoint licence is about £152. The separate examination fees are as follows: First, Second, and Third Professional £5 each; Final £15. On re-entry for any of the first three examinations £3, and on re-entry for the Final £5. If the re-entry is only in one or two subjects the fee are smaller.

Information concerning this Board should be sought either from Mr. D. I. Fadie, 49 Lauriston Place, Edinburgh, or from Mr. Walter Hurst, Faculty Hall, 242, St. Vincent Street, Glasgow.

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

This College has three grades—Licentiateship, Membership, and Fellowship—all of which are open to men and women. The regulations applying to candidates for the Licentiateship have already been generally indicated. If desirous of receiving it apart from those of the other two corporations they must be holders of a surgical qualification recognized by the College, and must pass an examination corresponding to the medical part of the Final Examination of the Conjoint Board, and conditioned in the same way, and also an examination in materia medica. The fee for examination is 15 guineas, a special examination being obtainable on due cause being shown, and on payment of 5 guineas extra. Ordinary examinations take place monthly on the first Wednesday, except in September and October. Candidates for the *Membership must be* either Licentiates of a British or Irish College of Physicians or alternatively graduates of medicine of a university approved by the Council, and in either case not less than 24 years of age. Candidates are examined in medicine and therapeutics, also on one or more departments of medicine specially professed, and approved by the Council, in which a high standard of proficiency will be expected. The fee to be paid by a candidate for the Membership is £36 15s. The examination is held quarterly, and application *for admission to it must be made a month previous* to its date. For the Fellowship the candidate must have been a member of the College for at least three years, and, if accepted, pays fees, including £25 stamp duty, amounting altogether to £64 12s. Further details can be obtained on application to the Secretary of the College.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH

This College has two grades—its Licence and its Fellowship. Licentiates may be of either sex, and for the Fellowship women are eligible also.

Licence.

As an original qualification the Licence is only granted after fulfilment of the regulations of the Conjoint Board, but as an additional qualification it can be obtained by those already possessed of a registrable qualification in medicine. In this case the candidate has to pass a written, oral, and clinical examination in surgery and surgical anatomy, and may be asked to operate on the dead body.

The fee is £15 15s. of which £10 10s. is returned to unsuccessful candidates. On due cause being shown a special examination may be granted the fee being £20 of which £10 is returned to a candidate if he is not approved.

Fellowship.

Candidates for the Fellowship must be not less than 25 years of age, and have been in the practice or study of their profession subsequent to registration for at least two years, and must hold either a surgical degree from a university recognized for that purpose by the College, or a registrable diploma obtained as the result of an examination which includes surgery as well as medicine and midwifery. Candidates are examined in (*a*) the principles and practice of surgery, including surgical anatomy, (*b*) clinical surgery, and (*c*) one optional subject, which they may choose from among the following: surgical pathology and operative surgery, ophthalmology, laryngology, otology, and rhinology, gynaecology, obstetric surgery, anatomy, and dental surgery and pathology. The examination is written, oral and clinical or practical. A candidate who desires to be examined must give one month's notice, his application for admission being supported by two Fellows of the College, one of whom must be resident in Edinburgh, or, in default, by testimonials specially obtained for the purpose. *Candidates are not allowed to appear more than three times at the examinations.*

Licentiates of the College pay £35, and others £45. For further information application should be made to the *Clerk of the College*, Mr. D. L. Fadie, 49, Lauriston Place, Edinburgh.

ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW

THIS body possesses two classes—Licentiates and Fellows The regulations applying to the former correspond with those respecting candidates for the Licence of the Royal College of Surgeons of Edinburgh Candidates for the single Licence are examined in surgery (including clinical surgery and surgical anatomy) The fee is £15 15s and examinations are held quarterly Candidates for the Fellowship must be qualified medical men of not less than two years' standing and 24 years of age Candidates approved at this examination are then eligible for election as Fellows Special regulations are in force for medical practitioners who served in the late war The Faculty can also elect four Fellows annually without previously submitting them to examination, providing they "have highly distinguished themselves in medical science or practice" They must be of not less than ten years' standing and 40 years of age Further information can be obtained from Mr Walter Hurst, Faculty Hall, 242, St Vincent Street, Glasgow

The Irish Universities.

THERE are three universities in Ireland, each with a medical faculty These are the University of Dublin (usually known as Trinity College, Dublin), the Queen's University of Belfast, and the National University of Ireland The two former teach students, examine them, and grant degrees, while the third is an academic body only, inasmuch as its practical work is divided among three constituent colleges, situated, one at Cork, another at Galway, and the third in Dublin Information as to the arrangements for the education of medical students will be found in the section relating to Irish Medical Schools

UNIVERSITY OF DUBLIN TRINITY COLLEGE

THIS university grants two degrees in medicine (M B and M D), two in surgery (B Ch and M Ch), two in midwifery (B A O and M A O), and a post-graduate diploma in public health It also grants a post-graduate diploma in gynæcology and obstetrics, for which nine months' study is required The degrees are granted to those who, having passed the Professional Examination, have also graduated in arts

PROFESSIONAL EXAMINATIONS

A candidate for the Final Examination for the M B, B Ch, and B A O degrees must be a matriculated student of at least five years' standing The examinations which students must pass are the Preliminary Scientific, the Intermediate Medical, and the Final Before admission to any of these examinations students must have completed the courses of study in the subjects involved

Preliminary Scientific—This covers (*a*) chemistry, (*b*) physics, (*c*) botany and zoology, the three divisions may be taken together or at different times

Intermediate Medical—This is divided into two parts (*a*) anatomy, physiology, organic chemistry, and histology, (*b*) applied anatomy and applied physiology The two parts may be taken separately or together

Final Examination—*Part I* Hygiene and medical jurisprudence, pathology and bacteriology, materia medica, and therapeutics *Part II* (*a*) Midwifery and gynæcology, (*b*) medicine and mental diseases, (*c*) surgery in all branches, including clinical ophthalmology The three sections of Part II may be taken separately or together In either case the full curriculum must have been completed, and the final examination cannot be completed before the end of the fifth year

M D—The candidate must have passed all the qualifying examinations in medicine, surgery, and midwifery, and have taken, or have been qualified to take, the degree of B A three years previously He must send in a thesis for approval Subsequently the Regius Professor of Physic and an assessor will discuss with him questions connected with the thesis and may also examine him viva voce on other medical subjects of a more general nature

M Ch—The candidate must be a B Ch of not less than three years' standing, and have been engaged in practice for two years

M A O—The candidate must be a B A O of not less than two years' standing and must produce satisfactory evidence of having been engaged for two years in obstetric science The examination is specially directed to obstetrics and practical gynæcology

Further information regarding courses of instruction, etc, may be obtained from the Registrar of the School of Physic, Trinity College, Dublin

QUEEN'S UNIVERSITY, BELFAST

THE degrees granted by the Medical Faculty of this university are as follows Bachelor of Medicine (M B), Bachelor of Surgery (B Ch), Bachelor of Obstetrics (B A O), Doctor of Medicine (M D), Master of Surgery (M Ch), Master of Obstetrics (M A O) The university also confers a diploma in public health The first three degrees mentioned serve as a qualification for admission to the *Medical Register*, and are not granted separately In addition to matriculating and passing his professional examinations, a candidate for these degrees must have passed three of the regulation five years as a student at the Belfast School of Medicine Degrees in dental surgery (B D S and M D S) are conferred by the university, and also a diploma in dental surgery (L D S)

PROFESSIONAL EXAMINATIONS

The examinations for the M B, B Ch, B A O are four in number The first deals with (1) Inorganic, organic, and practical chemistry, (2) experimental and practical physics, (3) botany and practical botany, (4) zoology and practical zoology It is divided into two parts, of which botany and zoology form one The Second Examination covers anatomy and physiology, and may be taken at the end of the second year of the student's career The Third Examination includes (1) Pathology, (2) materia medica, pharmacology, and therapeutics, (3) medical jurisprudence, and (4) hygiene To be valid a certificate in regard to the study of the subjects of this examination must show that the work has been done after the First Examination has been passed

The Final Examination includes (1) Medicine, (2) surgery, (3) midwifery, (4) ophthalmology and otology The student may pass in all subjects at once at the end of his fifth year, or he may divide the examination into two parts—namely, (1) systematic, (2) clinical, practical, and oral The first part may be taken at the end of the fourth year, but for the second part the candidate may not present himself until the end of his fifth year, but students invariably take both parts at the end of their course No certificate in regard to the study of the subjects of this examination will be valid unless the work was done subsequent to passing in all the subjects of the Second Examination

THE HIGHER DEGREES

Candidates for the degree of Doctor of Medicine must be graduates in medicine of at least three years' standing, unless they hold also a degree of the university in arts or science, in which case a standing of two academic years will suffice Moreover, candidates must be able to show that the interval has been passed in the pursuit of such courses of study or practical work as may be prescribed The degree may be conferred either (*a*) after a formal examination, or (*b*) in recognition of the merits of a thesis or of some piece of original study or research carried out by the candidate, followed by an oral or other examination in its subject When an ordinary examination is imposed it will include (1) a written paper on the principles and practice of medicine, (2) a commentary on a selected clinical case, (3) a clinical and viva voce examination, and (4) a written paper and clinical or practical and viva voce examination on a subject chosen from the following list (*a*) human anatomy, including embryology, (*b*) physiology, (*c*) pathology, (*d*) pharmacology and therapeutics, (*e*) sanitary science and public health, (*f*) forensic medicine and toxicology, (*g*) mental diseases The regulations for the degrees of M Ch and M A O are of the same general nature

NATIONAL UNIVERSITY OF IRELAND

THE National University of Ireland carries on most of its educational work through three constituent colleges—one in Dublin, one in Cork, and one in Galway. Each of these provides a full medical curriculum, and all candidates for the medical degrees of the university must pass three of their five years of study at one or other of them. These years do not count except after matriculation or recognition as a student of the Medical Faculty obtained in some other fashion. The candidates at each constituent college are examined thereat by the university, and a common standard of education is secured by all courses of instruction and the regulations concerning them having to be approved by the Senate, after considering report thereon from the Board of Studies of the university. In addition to the ordinary degrees in medicine and surgery, the university grants those of Bachelor and Master of Obstetrics, Bachelor and Doctor of Science in Public Health, and Bachelor and Master in Dental Surgery, as well as diplomas in Public Health, in Mental Diseases, and in Tropical Medicine.

Application for other information may be made to the Registrar, National University of Ireland, Dublin.

The Irish Corporations.

THERE are three licensing bodies other than the Medical Faculties of the Universities and in Dublin, just as in London, there is a Royal College of Physicians of Ireland, a Royal College of Surgeons in Ireland, and an Apothecaries Hall. In Ireland, as in England, the two Colleges have formed an examining Conjoint Board, which is responsible for the recommendation of candidates to the two bodies for their respective licences. The Apothecaries' Hall of Ireland, like the Apothecaries' Society of London, gives its licence separately.

THE CONJOINT BOARD IN IRELAND

This body requires of candidates the passage either of its own preliminary examination in the subjects of general education or proof that the candidate has passed one of the tests accepted by the General Medical Council as well as passing in the Pre-Registration Examinations in *Chemistry and Physics and Biology*.

PROFESSIONAL EXAMINATIONS

There are three professional examinations the first of which cannot be passed earlier than the end of the second winter session, nor the final before the conclusion of full five years of medical study. Before being admitted to any of them the candidate must show that he has studied the different subjects in practice and theory for the requisite periods, certificates to this effect being accepted from the authorities of most of the recognized medical schools at home and abroad. The first examination deals with (*a*) anatomy, and (*b*) physiology and histology. The second examination deals with (*a*) pathology, (*b*) materia medica, pharmacy, and therapeutics and ophthalmology, and may be taken separately.

Final Examination.—This is divided into three divisions, which cannot be completed until at least five years have passed in medical studies other than those for the Pre-Registration Examinations and five years at least since the beginning of the curriculum. The divisions are (*a*) medicine, including fevers, mental diseases, and diseases of children, (*b*) surgery, including operative surgery, (*c*) midwifery, including diseases of women and newborn children and the theory and practice of vaccination.

Fees.—Preliminary Examination £2 2s. Pre-examination £2 2s. Pre-Registration Examination £3 3. Re-examination in Chemistry £2 2s. in Physics £1 1s. First Professional Examination £15 15s. Second £15 15. Final £6 6s. Re-examination fee is £2 2s. for each division.

Diploma in Psychological Medicine

There are two examinations in connexion with this diploma. Part I consists of (*a*) anatomy and physiology of the nervous system, (*b*) psychology. Part II.—(*a*) neurology, including clinical and pathological neurology, (*b*) psychological medicine, including its legal relationships.

Fees.—£3 3 for each part.

Further information can be obtained from Mr. Alfred Miller, Secretary of the Committee of Management, Royal College of Surgeons, St. Stephen's Green, Dublin.

ROYAL COLLEGE OF PHYSICIANS OF IRELAND AND ROYAL COLLEGE OF SURGEONS IN IRELAND

The Diploma in Public Health

Every candidate for the Diploma in Public Health must observe the following rules:

Rule 1. A period of not less than two years shall elapse between the attainment by a candidate of a registrable qualification in Medicine Surgery and Midwifery and his admission to the Final Examination for a Diploma in Public Health.

Rule 2. The curriculum for the Diploma in Public Health shall extend over a period of not less than twelve calendar months subsequent to the attainment of a registrable qualification.

Rule 3. Every candidate shall produce evidence of having attended during a period of not less than five months at an institution approved by the Licensing Body granting the Diploma practical instruction in—

(*a*) Bacteriology and Parasitology (including Medical Entomology) especially in their relation to diseases of man and to the diseases of the lower animals which are transmissible to man.
(*b*) Chemistry and Physics in relation to Public Health.
(*c*) Meteorology and Climatology, in relation to Public Health.

At least 150 hours must be devoted to Course (*a*) of which not less than 150 hours shall be occupied in practical laboratory work.

At least 50 hours must be devoted to Course (*b*) of which not less than 40 hours shall be occupied in practical laboratory work.

At least 10 hours must be devoted to Course (*c*).

Rule 4. Every candidate shall produce evidence of having received during not less than 80 hours at an institution or from teachers approved by the Licensing Body, granting the Diploma instruction in the following subjects:

(*a*) The Principles of Public Health and Sanitation (*20*).
(*b*) Epidemiology and Vital Statistics (*20*).
(*c*) Sanitary Law and Administration (including Public Medical Services) (*20*).
(*d*) Sanitary Construction and Planning (*10*).

[The numbers indicate the normal proportion of time to be given to each subject.]

Rule 5. Every candidate shall produce evidence that he has attended for three months on the clinical practice of a recognized Hospital for Infectious Diseases and has received therein instruction in the methods of administration. At least thirty daily attendances of no less than two hours in each week shall be required.

Rule 6. Every candidate shall produce evidence that he has during a period of not less than six months been engaged in acquiring a practical knowledge of the duties routine and special of Public Health Administration under the supervision of a Medical Officer of Health who shall certify that the candidate has received from this Officer or other competent Medical Officer during not less than three hours on each of sixty working days practical instruction in these duties and also those relating to:

(*a*) Maternity and Child Welfare Service.
(*b*) Health Service for Children of School Age.
(*c*) Venereal Diseases Service.
(*d*) Tuberculosis Service.
(*e*) Industrial Hygiene.
(*f*) Inspection and Control of Food including meat and milk.

Certificates of having received the prescribed instruction in Public Health Administration must be given by a Medical Officer of Health who devotes his whole time to Public Health work or by the Medical Officer of Health of a Sanitary Area having a population of not less than 50,000 or in Ireland the Medical Superintendent Officer of Health of a County or County Borough having a population of no less than 40,000.

Rule 7. The examination for the Diploma shall be divided into two parts: Part I and Part II.

Rule 8. The examination for Part I shall include the following subjects:

Bacteriology and Parasitology (including Medical Entomology).
Chemistry and Physics and Meteorology and Climatology in relation to Public Health.

Rule 9. The examination for Part II shall include the following subjects:

Hygiene and Sanitation (including Sanitary Construction).
Epidemiology and Infectious Diseases.
Sanitary Law and Vital Statistics.
Public Health Administration.

The examination shall be written and oral and shall include practical examinations in Infectious Disease. Food inspection. Inspection of Premises—dwellings factories workshops schools etc.

ROYAL COLLEGE OF PHYSICIANS OF IRELAND

THOSE whose names already appear on the *Medical Register* can obtain the separate Licence in Medicine of this College, and its Licence in Midwifery. In either case an examination has to be passed in the subjects indicated, questions on midwifery, hygiene, and jurisprudence being included in the examination for the Licence in Medicine. For the Licence in Midwifery practitioners of over five years' standing are exempted from examination by printed questions. The other grades of the College are Members and Fellows. The former are admitted after an examination which is open to all university graduates in medicine and Licentiates in medicine of Royal Colleges of Physicians, and deals with the general subjects of medicine. Fellows

are selected, by vote, from among the Members of the College, irrespective of sex

Fees—For the Licence in Medicine, 15 guineas, Special Examination, £21, for the Licence in Midwifery, 8 guineas, Special Examination, 16 guineas For the Membership, 20 guineas to a Licentiate of the College, 35 guineas to others, a special examination costs 10 guineas extra The Fellowship, £35, in addition to stamp duty, £25

Information as to special examinations and other matters can be obtained from the Registrar, the Royal College of Physicians, Kildare Street, Dublin

ROYAL COLLEGE OF SURGEONS IN IRELAND

THIS body, besides granting a Licence in Surgery, admits those possessed of registrable surgical qualifications to its Fellowship under certain conditions Its Licence is usually granted conjointly with that of the College of Physicians, but it is given separately to holders of a registrable qualification in medicine, provided the College is satisfied that adequate courses of study have been pursued, and provided its own provisional examination is passed This examination is held on its behalf by the Conjoint Board, and is identical with the ordinary surgical portion of the examinations imposed by that body

The Fellowship—Candidates for the Fellowship must pass two examinations, of which the first is in anatomy (including , and histology, and the second in s gical anatomy) and pathology Both examinations are partly written, partly practical, and partly viva voce, while the final examination includes the performance of operations All subjects of either examination must be passed at one time, and to neither can a candidate be admitted who has been rejected in any of its subjects by any other licensing body within three months Candidates are not admitted to the Primary Examination except on evidence that they have already passed an examination in anatomy, physiology, and histology, held by some university or other body whose degrees or licences entitle the holder to admission to the *Medical Register*, if, however, the candidate's name is on the Colonial or Foreign List in the *Medical Register*, at the discretion of the Council Candidates for the Final Examination must be over 25 years of age, produce a certificate of general good conduct signed by two or more Fellows of the College, and, if successful, must make a declaration before admission to the effect that they do not conduct dispensing practices, and will not do so as long as they are Fellows

Fees—Candidates for the Licence pay 5 guineas for examination, which sum, if they pass, is counted as part of the fee payable on admission to the Licence, this being 25 guineas Candidates for the Fellowship pay 5 guineas for each examination, the total of 10 guineas being reckoned as part of the fee payable on admission to the Fellowship That fee is 25 guineas in the case of those who are already Licentiates, and 40 guineas in the case of others

APOTHECARIES' HALL OF IRELAND

A DIPLOMA is granted by this Hall which entitles the holder to be registered as a practitioner of medicine, surgery, and midwifery, and confers also the privileges of an apothecary Two periods of dissection, each not less than six months, must be included, and twenty-seven months of hospital attendance, or its equivalent Three professional examinations have to be passed, they are held three times a year The Primary Examination deals with biology, physics, and chemistry, practical and theoretical, the Intermediate Examination is in practical anatomy and physiology, and histology and *materia medica* A candidate who has passed tests in any of the subjects of these examinations before another licensing body is exempt from further examination in such subjects The Intermediate Examination, Part II, consists of pathology, medical jurisprudence, and hygiene The Final Examination deals with medicine, surgery, and midwifery, and pharmacy The Hall's own examination in all these subjects must be passed Women candidates are eligible

Fees—Primary Examination £10 10s Intermediate Examination £10 10s Final Examination £21 Final alone, when the others have been passed elsewhere, £26 5s

Application for other information should be made to the Registrar, 95, Merrion Square, Dublin

MEDICAL SCHOOLS AND COLLEGES.

LONDON

INFORMATION as to the fees at each of the various metropolitan medical schools, and the scholarships, prizes, and junior appointments which they offer, will be found in the following pages The courses they provide are fundamentally the same, and in all of them the arrangements made are such as to meet the requirements of students of every class—of those who are aiming at the diplomas of the English Conjoint Board or the Apothecaries' Society, not less than of those who have London or other university degrees in view At all, too, special facilities are offered to students who have commenced their professional education at Oxford or Cambridge

CHARING CROSS HOSPITAL

THIS school, with its hospital, is situated in the centre of London, and is easily accessible Primary and intermediate students attend lectures and practical work at King's College The final studies are taken in the school and hospital, where systematic lectures, demonstrations, and tutorial classes are arranged to cover all the subjects necessary for the qualifying examinations Departments are also available for the other final subjects of bacteriology, clinical pathology, materia medica, public health, operative surgery, and for research work An Institute of Pathology, with a whole-time staff of scientific workers and fully equipped laboratories, has been established in the school Students receive their training in preventive medicine, pathology, and bacteriology here, and are encouraged to undertake research

Women students are admitted to the school and hospital upon the same terms and conditions as men, and after qualification are eligible for resident hospital appointments A separate common room and a female attendant are provided, but beyond this no further distinction is made

The fees are as follows—Entrance Primary and Intermediate, 10 guineas, Final, 8 guineas Annual, £42

Further information may be obtained on application to the Dean of the Medical School, Charing Cross Hospital, London, W C 2

GUY'S HOSPITAL

THE hospital contains 626 beds in constant occupation Twenty-six beds are set apart for diseases of the eye, and 40 for the most urgent and interesting medical cases, which form the subjects of the weekly clinical lectures There is a special ward of 32 beds for the reception of cases of diseases of women and for cases of difficult labour Beds are also allotted to the throat and ear departments, the departments of orthopædics, neurology, and dermatology, the department for the treatment of diseases of the genito-urinary system, and the children's department there are also some special beds for the treatment of syphilis

The residential college fronts the east gate of the hospital, providing accommodation for resident students This contains a dining hall, reading rooms, a library of general literature, and a gymnasium for the use of the residents and of the members of the Clubs Union The athletic ground at Honor Oak Park is reached from the hospital in twenty minutes The Gordon Museum of Pathology, the Wills Library, the Departments of Chemistry, Physics, Pathology, and Pharmacology, and the school buildings in general, afford opportunities for a liberal education and for research, and provide the full curriculum for a medical qualification New departments of Anatomy, Physics, and Biology were opened in July, 1923 They are equipped on modern lines, and provide ample accommodation for teaching and research Special classes are held for the First and Second Examinations for medical degrees of the University of London and for the first F R C S Eng Special teaching is provided to meet the requirements of the Universities of London, Oxford, and Cambridge in general pathology and pharmacology

Appointments—All appointments are made according to the merits of the candidates, as determined by a committee of the medical staff Sixteen out-patient officers, eight

house physicians, twenty assistant house-surgeons, eight house-surgeons, four ophthalmic house surgeons, two genito-urinary house surgeons, two house physicians (children's department), and nine resident obstetric assistants are appointed annually. The house-physicians and house-surgeons, obstetric residents, ophthalmic house-surgeons, and genito-urinary house surgeons hold office for six months each, and receive free board and lodging in the college. Every student is provided with rooms and commons in the hospital during the period of his "take in" as senior dresser. In addition to the clerkships and dresserships in the medical and surgical wards, students are appointed to the posts or clinical assistant, dresser, or clerk in the special departments of ophthalmology, laryngology, gynæcology, diseases of children, diseases of the nervous system, dermatology, otology, actino-therapeutics, anæsthetics, dentistry, orthopædics, vaccine, tuberculosis, and genito-urinary and venereal disease; clinical assistantships in the various special departments are open to post-graduates.

Scholarships, Prizes, etc.—The following scholarships in Arts and Science are awarded: A. Open Junior Scholarships: (1) An Arts Scholarship of the value of £160; (2) a Science Scholarship of the value of £100; these are awarded annually in July. (3) A War Memorial Scholarship of the value of £200, awarded alternately in Arts and Science. This Scholarship is open every other year; the next award will be made in July, 1925. B. Confined Scholarship in Science. A Junior Science Scholarship of the value of £100 is offered for competition annually in September to candidates who have attended preliminary science classes at this school. Candidates for these scholarships (male students only) must be under 21 years of age on October 1st of the year of the competition. C. Open Senior Science Scholarships: (1) A War Memorial Scholarship of the value of £80; (2) an Open Scholarship of the value of £80; both of these are awarded annually in July. Full particulars as to the scholarships may be obtained from the Dean of the Medical School. Junior prizes for general proficiency £20, £15, £14. Hilton prize for Dissection, £5. Michael Harris prize for Anatomy, £10. Sand Cox Scholarship for Physiology, £15 for three years. Wooldridge Memorial prize for Physiology, £10. Beaney prize for Pathology, £34. Treasurer's gold medal in Medicine. Treasurer's gold medal in Surgery, and the Golding Bird gold medal and scholarship for Bacteriology (£20) are awarded annually after competitive examination. The Gull Studentship in Pathology of the value of £250 per annum; the Beaney Scholarship in Materia Medica of the annual value of about £50; and the Anderson Demonstratorship in Clinical Chemistry, value £150 per annum, are awarded without examination to enable research to be carried on in these subjects. An Arthur Durham Travelling Scholarship of £100 is awarded triennially. The Griffiths Demonstratorship in Pathology of the value of £320 per annum and the Hilda and Donald Poulton Fellowship, value £150 per annum, are awarded without examination.

An annual composition fee is paid by all students until a registrable qualification is obtained. Further information may be obtained from the Dean of the Medical School, Guy's Hospital, London Bridge, S.E. 1.

KING'S COLLEGE HOSPITAL

THE medical school of this hospital, which is situated at Denmark Hill, deals with the advanced or final subjects of the medical curriculum. The hospital was opened in 1913, and is the most modern and best equipped in England. The number of attendances in the casualty and out-patient departments during the year 1923 amounted to 208,955. In the education at the hospital a special feature has always been the individual attention given to each student. The studies are co-ordinated under the direction of senior members of the honorary staff, assisted by medical, surgical, obstetric, and pathological tutors. There are special departments for diseases of women and children, nervous diseases, ophthalmology, otology, laryngology, and rhinology, dermatology, radiology, and physico-therapy. The laboratory and pathological department are specially noteworthy.

Appointments.—Fifteen resident medical and surgical officers are appointed half-yearly, as well as dressers and clerks in the wards, out-patient departments, *post-mortem* room, and special department. Each of the special departments has several clinical assistants. There are three registrars and four tutors, all of whom receive salaries. The Clubs and Societies Union combines athletics, music, and other societies connected with the school, and provides also a common room.

Scholarships, etc.—At entrance: Science Scholarship £50. At commencement of Final Studies: Anatomy and Pathology Scholarship £50; Pathology and Pharmacology Scholarship £50; two Burney Yeo Scholarships, each £20 (for Oxford and Cambridge students); Epsom College Scholarship £50. Senior Scholarship £40, Todd Prize, Tanner Prize, Clay Prizes and Medals.

Fees.—The composition fee is 95 guineas if paid in one sum. Entrance fee of 10 guineas includes membership of the Clubs and Societies Union.

The calendar of the school can be obtained on application to the Dean, H. Willoughby Lyle, M.D., F.R.C.S., or to the Secretary, S. C. Panner, M.A., King's College Hospital, Denmark Hill, S.E. 5.

THE LONDON HOSPITAL

THIS hospital with its medical college and dental school, is situated in the Mile End Road, E. 1. The hospital contains 948 beds, and during 1923, 17,977 patients passed through the wards and 119,749 out-patients received treatment. Of the latter number, 39,092 received treatment in the departments for diseases of the ear, nose, throat, eye, skin, and teeth, and in the pediatric, orthopædic, venereal, radiological, electro- and physico-therapeutical and inoculation departments. The number of major operations which were performed amounted to 7,543.

The hospital presents therefore a large field for clinical instruction and in its wards and out-patient and special departments exceptional opportunities are afforded for acquiring an extensive and practical experience of all phases of disease.

A clinical unit in medicine, under the charge of a whole-time director, provides for the more elaborate methods of diagnosis and treatment, and takes a leading part in the initiation and co-ordination of medical research. To each medical and surgical firm throughout the hospital there is attached a first assistant, who is responsible for instructing the clerks or dressers of the firm in elementary medicine and surgery, and who assists the honorary members of the firm in the preparation of their demonstrations. Special courses of lectures and demonstrations are arranged in medicine and surgery and in their ancillary subjects. Opportunities for research are provided under the supervision of the staff.

All the departments are modern and adapted for the teaching of all subjects in the various curricula. Special courses of instruction are held in preparation for the examinations of the University of London, for the Fellowship or the Royal College of Surgeons, and for the Membership of the Royal College of Physicians. Special entries can be made for the medical and surgical practice of the hospital. A residential hostel on hospital ground is provided for the convenience of students who wish to live near the wards and casualty departments. The athletic ground, of over thirteen acres, is at Highams Park, and is open to all members of the Clubs Union.

Appointments.—The salaried appointments open to past students of the hospital are those of assistants to the medical unit, first assistants to the medical and surgical firms, obstetric registrar, medical, surgical, and obstetric tutors, clinical assistants in the medical, surgical, ophthalmic, aural, light and skin, orthopædic, and electrical departments, and in the Pathological Institute. There are appointed annually 4 resident accoucheurs, 14 resident house physicians and 22 resident house-surgeons, 14 resident receiving room officers, 8 resident emergency officers, 8 clinical assistants to the medical out-patient department, and 16 clinical assistants to the surgical out-patient department; also paid and unpaid clinical assistants in the various special departments. In addition there are numerous assistantships, clerkships, and dresserships in the departments of medicine, surgery, gynæcology, and obstetrics.

Scholarships and Prizes.—The following list of scholarships and prizes:—At Entrance: Price Scholarship in Science, £50. Price Scholarship in Anatomy and Physiology, open to students of Oxford and Cambridge Universities, £15. Entrance Scholarship in Science, £50. Epsom Scholarship. Free Medical Education. After Entrance: Buxton Prize in Anatomy and Physiology, £40. Lichfield Prizes in Organic Chemistry and Chemical Pathology, £25. Prizes in Clinical Medicine, Surgery, and Obstetrics and Gynæcology, £20 each. Duckworth Nelson Prize in Practical Medicine and Surgery, £10. Hutchinson Prize in Clinical Surgery, £10. Sutton Prize in Pathology, £20. Sir Andrew Clark Prize in Clinical Medicine and Pathology, £28. Anderson Prize in Elementary Clinical Medicine, £20. Dresser Prizes, £40. Practical Anatomy Prizes, £19. Arnold Thompson Prize in Medical and

Surgical Diseases of Children, £15, Liddle Prize £120, Francis Palmer Scholarship in Dental Surgery, £25, Harold Tink Prize in Dental Surgery £8 8s The 'London' prizes in Dental Surgery and Pathology, £5 5s, and in Dental Prosthesis £5 5s Seven class examination prizes, each of the value of £3 3s, are offered for competition at the end of the courses of lectures in the dental curricula The London Hospital Medical College and the Eliza Ann Alston Medical Research Funds amount to over £26,000

Fees—Entrance fee, 20 or 15 guineas, according to examinations passed, annual fee, 40 guineas

Full information may be obtained from the Dean at the London Hospital Medical College, Mile End, E 1

THE MIDDLESEX HOSPITAL

THE school and hospital are in Mortimer Street, W, close to Oxford Circus, Goodge Street, and Great Portland Street stations There are prosperous athletic clubs and a gymnasium within the hospital precincts The hospital contains over 450 beds, including a wing containing 92 beds for patients suffering from cancer There are special wards for maternity and gynaecological cases, for mental cases, for cases of venereal disease, and for diseases of children and of the skin and eye

The medical school, which includes the Bland-Sutton Institute of Pathology and the cancer research laboratories, is completely equipped for teaching the entire medical curriculum, including the pre-medical subjects, chemistry, physics, and biology The Bland-Sutton Institute, under the charge of the Professor of Pathology, contains large pathological and public health laboratories, and smaller rooms for original investigation as well as a pathological and anatomical museum Bacteriological, chemical, and microscopical examinations of material from the wards, operating theatres, and out-patient departments are carried out in the laboratories, and senior students are eligible for clerkships in connexion with this work Every facility is given for original research The cancer research laboratories offer unrivalled opportunities for the study of this disease, in both its clinical and pathological aspects Several valuable scholarships are awarded in this connexion Students also receive special instruction in the electro-therapeutic and electro-cardiographic departments

Appointments—Twenty-two resident appointments are open annually for competition among students of the hospital The officers reside and board in the residential college free of expense Two casualty medical and two casualty surgical officers, and two resident officers to the special departments, are appointed annually Eight house-surgeons are appointed every year at intervals of two months, after examination, six house-physicians are also appointed annually at similar intervals An obstetric and gynaecological house-surgeon is appointed every six months Eight registrars are appointed annually In the out-patient departments the appointments are clerk and dresser to the physicians and surgeons to out-patients, clerk in the departments for diseases of the skin and nervous diseases, dressers to the department for diseases of women, to the ophthalmic surgeon, to the throat and ear department, and to the dental surgeon Extern midwifery clerks and post-mortem clerks are also appointed The appointments are so arranged that every student may, during his course, hold all the out-patient and in-patient clerkships and dresserships Students must have held an out-patient clerkship and dresserships before holding in-patient clerkships or dresserships Non-resident qualified clinical assistants are appointed in the medical, surgical, skin, neurological, ophthalmic, throat and ear, odontological, children's and electro-therapeutic out-patient departments

Scholarships—There are two Entrance Scholarships, value £100 each An annual Entrance Scholarship of the value of £50 is open to students of the universities or the United Kingdom who have completed the curriculum for, or passed the examinations in anatomy and physiology Students joining the school in the previous April are eligible The Freer Lucas Scholarship is annually awarded on the nomination of the head master to a pupil of Epsom College who has passed the first examination for medical degrees (Preliminary Scientific Examination) There is also a scholarship, value £50 awarded annually to students from New Zealand In addition to the Entrance Scholarships there are numerous other valuable scholarships prizes and exhibitions open to students of the hospital including the Brodrip Scholarship, value £60 and £10, Lyell Gold Medal and Scholarship, value £55 5s, Freeman Scholarship, value £30, John Murray Gold Medal and Scholarship, value £25, Hetley Clinical Prize, value £25, Leopold Hudson Prize, value 11 guineas, and the Second Year's Exhibition, value 10 guineas

Fees—(a) Pre medical students For one year or less, £21 (b) Students who have completed the Preliminary Science course Entrance fee, 15 guineas, five annual fees of £42 The annual fee for further attendance at the medical school, if a registrable qualification has not been obtained, is £21 Three quarters, one half, or one quarter of the last annual fee may, at the discretion of the School Council, be returned if the student obtains a registrable qualification within three, six, or nine months of the annual payment becoming due (c) Oxford and Cambridge and other students who have completed the Intermediate course Entrance fee, 10 guineas, two annual fees of £42, further annual fees as above

Further information may be obtained from the Dean or the School Secretary

ST BARTHOLOMEW'S HOSPITAL

THIS institution fills one side of Smithfield and Giltspur Street, covering the greater part of a large island of ground separated practically from all other buildings, it is on the edge of the City, and easily reached from all parts of London The hospital contains 757 beds Extensive buildings, opened in July, 1907, occupy part of the ground acquired from the old Bluecoat School, and these materially enhance the attractions of the hospital as a place of medical study The medical school buildings, including the library, the museum, and the chemical, biological, and anatomical departments have now at their side a very large building, which includes club rooms for the Students' Union, a writing room, luncheon and dining halls, new quarters for the resident staff, and an out-patient department and accommodation for special departments of such large size as to be unsurpassed by any hospital in the kingdom During the year 1909 a second block of new buildings was completed These form the pathological department, and include, in addition to an extensive post-mortem room, large and well equipped laboratories for clinical pathology, pathological histology, bacteriology, and chemical pathology, altogether forming the most complete pathological department in the country A further large block in Giltspur Street was acquired in 1923, and has been equipped by the construction of new lecture theatres and extensive laboratories for physics, chemical physiology, experimental physiology, histology, and pharmacology Within the precincts of the hospital also there is a residential college for a large number of students The Students' Union owns, moreover, grounds of some ten acres in extent for recreative purposes at Winchmore Hill, which is easily accessible from the hospital

Special classes are held for students preparing for the Preliminary Scientific and other examinations, for the M B, M D of the Universities of London, Oxford, and Cambridge, and for the higher surgical degrees at the same universities, including the M Ch Oxon, M Ch Cantab, M S Lond, and F R C S Eng Special laboratory instruction for the D P H of Cambridge, Oxford, Durham, and London is also given

Clinical Units—Special Clinical Units have been established in Medicine and Surgery, each under the charge of a professor and director who devotes the whole of his time to the purpose of hospital practice, teaching, and research In each unit there are an assistant director and four assistants, for whom special laboratory accommodation has been provided by a gift from the Sir William Dunn Trustees The appointments of clerks and dressers are open to all students in these departments, and arrangements are made for all students to study in these units during a part of their clinical course

Appointments—Clinical clerks to the physicians and to the physician-accoucheur, and dressers to the surgeons and in the casualty department, are chosen from the students, clerks and dressers are also selected from the students to attend in the out-patient rooms, in the special departments (ophthalmic orthopaedic, gynaecological, children's, laryngological, aural, dermatological, venereal, electrical, and dental), and in the post-mortem room Chief assistants and clinical assistants are selected from qualified men appointed yearly to help in the general medical, surgical, and in the special departments Ten house-physicians and ten house-surgeons are appointed annually During their

first six months of office they act as "junior" house-physicians and house-surgeons, and receive a salary of £80 a year. During their second six months they become "senior" house physicians and house-surgeons, and are provided with rooms by the hospital authorities, and receive a salary of £80 a year. A resident midwifery assistant, an ophthalmic house surgeon, a house-surgeon to the skin and venereal department, and a house-surgeon for diseases of the throat, nose, and ear are appointed every six months, and are provided with rooms and receive a salary of £80 a year. Three resident administrators of anæsthetics are appointed, the senior for one year at a salary of £150, and two juniors for six months with a salary at the rate of £80 per annum, and all are provided with board and rooms. An extern midwifery assistant is appointed every three months, and receives a salary of £80 a year.

Scholarships.—Four entrance Scholarships are annually awarded after an examination held in September. The subjects of examination and conditions of eligibility for these scholarships are: (1) One scholarship value £75 in not fewer than two and not more than three of the following subjects: Chemistry, Physics, Botany, Zoology, Physiology, and Anatomy; limited to students under 25 years of age who have not entered on the medical or surgical practice of any London medical school. (2) One scholarship value £100, in not fewer than three of the following subjects: Chemistry, Physics, Botany, Zoology, and Physiology; limited to students under 21 years of age who have not entered on the medical or surgical practice of any London medical school. (3) The entrance scholarship in Arts of the value of £100 will be given in Latin and mathematics with one other language—Greek, French, or German. (4) The Jefferson Exhibition in Mathematics, Latin, and one other language—Greek, French, or German—of the value of £50. The value of the scholarships and prizes is over £900 annually.

Further information and a handbook can be obtained on application to the Dean of the Medical College, St Bartholomew's Hospital, E.C.1.

ST GEORGE'S HOSPITAL

THIS school is at Hyde Park Corner, and is carried on in *connexion with St George's Hospital, an institution having* a service of 436 beds, of which 100 are at the convalescent hospital at Wimbledon. It provides for the instruction of its students in the preliminary and intermediate subjects of the curriculum at the teaching centres of London University established at King's College and University College. The school at Hyde Park Corner is devoted entirely to the teaching of clinical subjects, great attention being paid by the members of the staff to individual teaching. A number of special courses are given, in which the requirements of university and all other examinations receive careful attention.

The St George's Hospital Club consists of an amalgamation club, with smoking and luncheon rooms on the hospital premises, and other students' clubs, with an athletic ground at Wimbledon. Students have the advantage of a well filled library of medical and scientific books. A register of accredited apartments and a list of medical men and others willing to receive St George's men as boarders may be seen on application to the Dean.

Appointments.—Two house physicians, two house surgeons, and two casualty officers are appointed every three months. The house officers reside and board in the hospital free of expense. The casualty officers are non-resident, and receive salaries at the rate of £100 per annum. After the student has held a house appointment, the following are, among others, open to him: Medical registrarship at £200 per annum, surgical registrarship at £200 per annum, assistant curatorship of the museum, £100 per annum, obstetric assistantship resident at £50 per annum, the post of resident anæsthetist at £100 per annum, the posts (two) of junior anæsthetist, each at £30 per annum.

Scholarship.—The following Entrance Scholarships and Exhibitions in Anatomy and Physiology are awarded in July to candidates who have passed the second M.B. London or corresponding examination. Senior Scholarship of the value of 90 guineas. Junior Scholarship of the value of £70. Devitt-Pendlebury Scholarship of the value of £50, and Exhibitions each of the value of £40 and up to eight in number. The William Brown Exhibition of the value of £150 per annum (tenable for two years) is awarded by examination to a perpetual pupil of the hospital every second year. The William Brown Exhibition is £49 (tenable for three years) and is awarded by examination to a perpetual pupil of the hospital every third year. Other prizes to the value of £200 are awarded annually to the students of the hospital.

Fees.—First year £36 15, second and third years £42 each. For the course of clinical study in the fourth and subsequent years entrance fee £10 10s., annual composition fee £42. No entrance fee is payable by St George's students who have studied at King's and University Colleges.

Further information may be obtained from the Dean of the Medical School.

ST MARY'S HOSPITAL

THIS hospital and medical school are situated close to Paddington Station (G.W.R.), having on one side a poor district of 500,000 persons, and on the other side the residential district of Kensington and Bayswater. The hospital contains 505 beds, and, by a scheme of affiliation, for teaching purposes, of several neighbouring hospitals, the teaching facilities extend over 1,000 beds. By arrangement with the Lock Hospital, students take the courses of instruction in venereal diseases there. The athletic ground (ten acres) is situated at Wembley, *and can be reached in twenty* minutes by a constant service of trains, a large pavilion has recently been erected.

Clinical Facilities.—Clinical Units in Medicine and Surgery were established in 1920, and have now been formally recognized by the University Grants Committee, St Mary's being one of the six medical schools in London which enjoy this privilege. In addition to the lying-in beds at St Mary's, every student attends a short course at Queen Charlotte's Maternity Hospital (which is situated near to St Mary's) before holding a post on the maternity district of the hospital.

Institute of Pathology and Research.—Students specially interested in pathology and bacteriology have singular advantages at St Mary's. The Institute comprises seven special departments, the whole being under the personal direction of Sir Almroth Wright, F.R.S. Research scholarships of £200 each are awarded annually to students working in the departments of the Institute, and research beds are provided. Clerkships in pathology and bacteriology and chemical pathology, lasting for a period of three months, are open to students of the fifth year, and enable them to carry out the pathological and bacteriological investigation of the wards, and learn the necessary technique under supervision. Seventy-two of these posts are available annually.

Complete Curriculum.—The medical school provides complete courses of instruction, and students can join at once on passing a Preliminary Examination in Arts. Terms begin in October, January, and April.

Entrance Scholarships.—Three entrance scholarships of £210 each and one of £26 5s. are awarded annually in July by nomination on the lines of the Rhodes Scholarships. Two University Scholarships of £200 are awarded annually in July.

Fees.—Composition fees for entire curriculum (5½ years) £200 in one sum or £210 by five annual instalments. Composition fee for clinical curriculum (2½ years) 90 guineas in one sum or £5 guineas by two annual instalments. As an alternative students may pay an annual fee of 40 guineas with an entrance fee of 10 guineas.

ST THOMAS'S HOSPITAL

THIS school and hospital are situated in Lambeth, on the south bank of the Thames, facing the Houses of Parliament and form one of the well known architectural features of London.

The school buildings, which are separated from the hospital by a quadrangle, comprise lecture theatres, laboratories, and classrooms well adapted for the modern teaching of large bodies of students in the subjects of the medical curriculum. A splendid library and reading room and a complete museum are open to all students from 9 a.m. to 5 p.m., on Saturdays to 1 p.m. The Students' Club premises contain a dining room and smoking and reading room supplied with daily and illustrated weekly papers, and a gymnasium. Good meals are obtainable at a moderate tariff. The terrace affords facilities for exercise and recreation. The sports ground, of more than nine acres in extent is at Chiswick. It can be reached in forty minutes from the hospital, it is admirably adapted for football, cricket, lawn tennis, and athletic sports.

The hospital proper contains 632 beds. In addition to the ordinary provisions of a great hospital there are connected

with the out-patient department physicians' and surgeons' rooms provided with ample sitting accommodation, so that students are enabled to follow closely the practice and teaching of the out-patient staff There is a full complement of special departments, and connected with the hospital a special tuberculosis department gives opportunity for instruction of students There is a clinical theatre, centrally situated, so as to facilitate the illustration of lectures by patients from the wards and out-patient room, it is arranged also for lantern demonstrations The maternity ward, containing 20 beds, gives students full facilities for maternity training, under supervision, within the precincts of the hospital This obviates any necessity for supplementary instruction elsewhere, and fully prepares the student for the extern maternity practice of the hospital district The revised regulations of the examining bodies can thus be fully complied with

Appointments.—All hospital appointments are open to students without charge A resident assistant physician, a resident assistant surgeon, and a resident anaesthetist are appointed annually at a salary of £200 each per annum Two hospital registrars, medical and surgical, at an annual salary of £250 each, are appointed yearly The tenure of these offices may be renewed for a term not exceeding two years An obstetric tutor and registrar, an ophthalmic registrar (at an annual salary of £50 each), and an orthopaedic registrar (unpaid) are appointed yearly Ten resident casualty officers and anaesthetists (including two senior) are appointed every six months Seven house-physicians (including two obstetric house-physicians and one house-physician to the department of diseases of children) and nine house-surgeons (including two ophthalmic house-surgeons, one orthopaedic house-surgeon, and two house-surgeons to the ear, nose, and throat department) are appointed every six months Eight or more clinical assistants in the special departments are appointed every three months, and hold office for six months if recommended for re-election Clinical clerkships and dresserships to the in-patient and out-patient departments are available to the number of 400 each year

Scholarships.—There are five entrance Scholarships Two in Arts, giving one year's free tuition, one of £150 and one of £60, in Chemistry, Physics, and Biology, for students who have not received instruction in Anatomy or Physiology, one of £100 in any two of the following subjects Anatomy, Physiology, or Chemistry, for students who have completed their examinations in Anatomy and Physiology, for a medical degree in any of the universities of the United Kingdom or the Colonies, and have not entered as clinical students in any London medical school The money value and subjects of examination of the remainder are as follows (*a*) William Tite Scholarship for second year students, £25, (*b*) and (*c*) Musgrove Scholarship or (alternately) Peacock Scholarship each for third-year students and tenable for two years, £35 each (*d*) Cheselden Medal, Surgery and Anatomy, (*e*) Mead Medal, Medicine, Pathology, and Hygiene, (*f*) Toller Prize, Medicine Pathology, and Hygiene (*g*) Bristowe Medal, Pathology, and Morbid Anatomy, (*h*) Solly Medal and Prize, *biennially*, Surgical Report, (*i*) Clutton Memorial Medal in Clinical Surgery, biennial, (*j*) Wainwright Prize, Medicine, Pathology, and Hygiene (*k*) Hadden Prize, Pathology, (*l*) Berney Scholarship, £50 biennially Surgery and Surgical Pathology, (*m*) Sutton Sams Prize, biennially reports of cases in Obstetric Medicine, (*n*) Grainger Testimonial Prize, £31 10s Anatomy and Physiology (*o*) Louis Jenner Research Scholarship, tenable for two years, £60 annually, Pathology

Fees.—The annual fees are For each year of study £50 These fees cover all tutorial classes, but do not include instruction in infectious fevers pharmacy and vaccination Qualified practitioners are permitted to attend the hospital practice on terms which may be ascertained from the Medical Secretary

Special courses of instruction are given for various examinations, and a register of lodgings is kept at the school Further information may be obtained from the Medical Secretary of the School, St Thomas's Hospital, Albert Embankment, S E 1

UNIVERSITY COLLEGE HOSPITAL

THE school, which forms part of the Corporation of University College Hospital, is in immediate proximity to the hospital in University Street, and opposite University College It comprises departments of medicine and clinical medicine, surgery and clinical surgery, midwifery and gynaecology pathology including morbid anatomy, chemical pathology, biochemistry and bacteriology, cardiography, forensic medicine, mental physiology and mental diseases, dental surgery, practical pharmacy, and other departments for the study of special diseases, such as those of the eye, skin, ear and throat, venereal diseases, and for instruction in anaesthetics, electro-therapeutics, and skiagraphy The Hospital and School have acquired the National Dental Hospital and College as their Dental Departments, thus providing every facility for the study of dental subjects The Royal Ear Hospital, Dean Street, Soho, has also been amalgamated as the Ear, Nose, and Throat Department

The school thus provides the final course of study for the degrees of the Universities of London, Oxford, Cambridge, Durham, and other British universities, and for the diplomas of the Royal Colleges of Physicians and Surgeons in Medicine and Dental Surgery, and the Licence of the Society of Apothecaries Special bacteriological classes are also held in preparation for the various diplomas in public health Each department is also equipped for more advanced work, and provides facilities for research

Clinical Units in Medicine and Surgery are now in operation The whole-time directors of the Units are concerned with the organization of the teaching generally, but the honorary staff is responsible for the largest share of the teaching in the wards and out-patient department of the hospital A Unit in Obstetric Medicine will be established as soon as the new obstetric hospital now in course of construction is finished

The new buildings of the obstetric hospital of 60 beds (rendered possible by the Rockefeller benefaction), the new Residents' House (with accommodation for 30 residents and students), the extension of the Nurses' Home, and the new research laboratories for the Medical School, are well under way, and these buildings should be ready for occupation by the spring of 1925

Scholarships.—The following scholarships and prizes are open to competition Two Entrance Exhibitions of £12 guineas each, awarded after a competitive examination in anatomy and physiology, Radcliffe Crocker Travelling Scholarship in dermatology for one year, value about £280 the Graham scholarship in pathology of a sum not exceeding £300 per annum, Leslie Pearce Gould Research Scholarship in surgery for one year, value about £200 the Atkinson Morley Scholarship of £45 a year for three years awarded after examination in the theory and practice of surgery the Atchison Scholarship of £55 a year for two years for general proficiency in medical studies, the Magrath Clinical Scholarship value about £100 the Fillitei Exhibition in pathology of £30, the Percival Alleyn Prize for the advancement of surgery by research value about £60, the Graham Gold Medal for research work four Fellows Medals in clinical medicine, Liston Medals in clinical surgery, the Bruce Medal in pathology and surgery, two Tuke Medals in pathology, and the Erichsen Prize for practical surgery

Fees.—The fee for the full course of final studies at the school is 112 guineas if paid in one sum, or 115 guineas if paid in two instalments Fees for vaccination and fevers not included

Appointments.—The qualified appointments, in addition to a number of posts as house-physicians and house-surgeons and obstetric assistants, include the appointments of resident medical officer, surgical registrar, obstetric registrar, Harker Smith radium registrar, casualty medical officers, casualty surgical officers, assistants in ear, nose and throat, ophthalmic, skin and venereal diseases departments, and house anaesthetists

Particulars of general and special courses can be obtained on application to the Dean of the Medical School, University College Hospital, University Street, W C 1

WESTMINSTER HOSPITAL

THIS school, with its hospital, situate in Broad Sanctuary, opposite Westminster Abbey, provides for the education of its students in the preliminary and intermediate subjects of the University of London at King's College The rest of the work is done in the school buildings near the hospital The number of in-patients averages 3,000 and out-patients upwards of 30,000 annually, and the hospital and school afford ample facilities for instruction in all branches of medicine and surgery

Appointments.—A medical and surgical registrar are appointed annually, each with a salary of £150, and obstetric registrar with a salary of £50 Three house-physicians, three house-surgeons, one assistant house-physician, one assistant house-surgeon, and a resident obstetric assistant are appointed after examination, and are provided with rooms commons, and salary of £52 per

annum, except the assistant house-physician and the assistant house-surgeon, who are provided with commons only The assistant house-physician after three months' service becomes house-physician for a further period of six months, and the assistant house-surgeon after three months' service becomes house surgeon for a further period of six months Clinical assistants to the assistant physicians and assistant surgeons, and to the officers in charge of special departments, are appointed from among the qualified students Every student must perform the duties of out-patient dresser for four months, and afterwards hold the office of in-patient dresser for four months He is also required to serve two terms of four months each as medical clinical clerk to in patient physician and one term as gynaecological clinical clerk Two pathological clerks are appointed every three months to assist in the *post mortem* room No student is eligible as an in-patient dresser or clinical clerk until he has passed the Second Examination of the Conjoint Board, or an equivalent examination Clerks and dressers in the special departments of hospital practice are periodically appointed So far as vacancies permit, students of other hospitals are admitted to in-patients' dresserships or clerkships

Scholarships—The following open scholarships are offered for competition during the year 1924-25 In the winter session two scholarships in anatomy and physiology £70 each In the spring two scholarships in anatomy and physiology £70 each A certain number of scholarships have been allotted to universities of England Wales and the Colonies and to public schools These scholarships are awarded entirely on the nomination of the Principal of the University or School

Fees—The annual composition fee is 35 guineas An entrance fee of 10 guineas is payable by all students—namely primary and intermediate students £10 10s students entering for the final subjects £8 8s These fees include subscriptions for membership of the Clubs Union

Further information and a prospectus can be obtained on application to the Dean at the Westminster Hospital, Westminster, S W 1

The governors of the hospital have now completed the extensive improvements and alterations to the hospital, which render it a still more efficient teaching institution, with an increased number of beds

---

LONDON (ROYAL FREE HOSPITAL) SCHOOL OF MEDICINE FOR WOMEN

THE school is situated at 8, Hunter Street, Brunswick Square, W C 1, close to the Royal Free Hospital It is, like all the other London schools which have so far been mentioned, one of the constituent schools of London University The school buildings have recently been enlarged The laboratories are extensive and well lighted, and are fully equipped for the examination courses of the University of London and the Royal Colleges of Physicians and Surgeons Research laboratories are attached to all departments A large, well equipped library, common room, Union room, and refectory are provided for the use of students Resident accommodation for 60 students is provided in students' chambers attached to the school

The Royal Free Hospital, Gray's Inn Road, W C 1, has 240 beds, all of which are available for clinical instruction A new block contains the Obstetrical and Gynaecological Unit, which, with the Marlborough Maternity Department controls 68 beds There are separate departments for diseases of the eye, ear, and skin, infant welfare, venereal diseases, massage, electrical and *x*-ray work, dentistry, and casualty The instruction given covers the full curriculum for the M B, B S degrees of the University of London, including first medical courses Students attend the practice of one of the fever hospitals of the Metropolitan Asylums Board and receive special instruction in lunacy at Bethlem Hospital, they are also admitted to the practice of a number of special hospitals, and hold clerkships and dresserships at the Elizabeth Garrett Anderson Hospital, the Cancer Hospital, Hospital for Sick Children the National Hospital for Nervous Diseases the South London Hospital, and the Royal Ophthalmic Hospital The work of the school includes preparation for the Primary Fellowship examination, and also for the Medical school and general hospital course for dental students

Appointments—Qualified students of the school can obtain appointments as house-physicians and house surgeons, obstetric assistants, surgical, gynaecological, and medical registrars, assistant pathologists, assistant anaesthetists, medical electrician, skiagrapher, and clinical assistants and demonstrators in various subjects

Scholarships—The Isabel Thorne Entrance Scholarship value £30 the St Dunstan's Medical Exhibition value £60 a year for [illegible] extended to five years and the Mabel value £20 a year for four years each year The Sir Owen Roberts [illegible] alue of £75 a year for four years the Mrs George M Smith Scholarship of the value of £50 a year for three years which may be extended to five years the Dr Margaret Todd Scholarship of the value of £37 10s a year for four years and the Sarah Holborn Scholarship of the value of £20 a year for three years which may be extended to five years are awarded in alternate years The Bostock Scholarship value £80 a year for two or four years is awarded by the Reid Trustees on the result of an examination held in May by the University of London every fourth year The holder of the cholarship must enter the London School of Medicine for Women The Lieutenant Edmund Lewis and Lieutenant Alan Lewis Memorial Scholarship of the value of £25 a year for four years is awarded every fourth year The John Byron Bursary of £20 a year for two years the Helen Prideaux Prize of £40 the Mabel Webb Research Scholarship of £30 for two years the Fanny Butler Scholarship of £14 10s a year for four years together with many other scholarships and prizes are offered on sundry conditions The Dr Edith Pechey Phipson Post Graduate Scholarship of £100 is awarded annually Various missionary societies also offer scholarships on certain conditions and assist ladies who wish to go to India and other countries as medical missionaries

Fees—Courses for the University of London degrees and the diplomas of the Conjoint Board in England and other qualifications £240 payable in five instalments These sums include library and laboratory fees

The Students' Union exists to promote corporate action of the students on matters of common interest, to promote and maintain athletic and other clubs and to issue a school magazine All students are required to become members of the Union

Further information can be obtained from the Warden and Secretary

---

KING'S COLLEGE

IN the Faculty of Medical Science instruction is given in the preliminary and intermediate subjects of the first and second examinations leading to the degree of M B, B S of the University of London, of the corresponding examinations of other universities, and of the Conjoint Examining Board of the Royal Colleges of Physicians and Surgeons, including the primary examination for the F R C S Eng The courses are open to women students on the same terms as to men

Regular students who have completed their preliminary and intermediate examinations proceed to a hospital to pursue their studies for the final examinations The hospitals associated with King's College are King's College Hospital, Denmark Hill, S E 5, Westminster Hospital, S W 1, St George's Hospital, Hyde Park Corner, S W 1, and Charing Cross Hospital Strand, W C 2

There is a Department of Public Health and Bacteriology under the direction of Sir William J Simpson and Professor R T Hewlett Full particulars of this department may be obtained from the Secretary of the College

A course for the diploma in dental surgery in conjunction with King's College Hospital Medical School has been arranged Full details may be obtained on application to the Secretary, King's College Hospital Medical School, Denmark Hill, S E 5

Scholarships—The entrance Scholarships are (1) Two Warneford Scholarships each £30 for four years subjects—selected from mathematics classics divinity and science (2) One Sambrook Scholarship of £30 for three years subjects of examination selected from mathematics classics and science The holders of the preceding awards must proceed to King's College Hospital (3) Worsley, £100 paid in five annual instalments (4) Rabbeth Scholarship value £20 in July for the best student of the first year (5) Second year's scholarship value £20 for the best student of the second year (6) Daniell Scholarship £40 awarded on the results of the University Honours Examination

Full information as to admission, fees, and scholarships can be obtained from the Dean of the Faculty of Medical Science (Professor E Barclay-Smith), King's College Strand, W C 2

UNIVERSITY COLLEGE

THIS institution, one of the principal component parts of the University of London, possesses a Faculty of Medical Sciences whose work covers all the subjects included in the group commonly known as the preliminary medical sciences—namely, physics, chemistry, botany, and zoology, and also the intermediate medical sciences—namely, anatomy, physiology, and pharmacology The new anatomy building, provided by the munificent gift of the Rockefeller Foundation of New York, was opened on May 31st, 1923, by His Majesty the King This building forms part of the block which includes physiology and pharmacology The Department of Hygiene and Public Health prepares for the diplomas in public health of the Royal Colleges and of the various universities Research work is undertaken in all the above-named departments The College undertakes the education of students in all the subjects mentioned, leaving them free to complete their education in the strictly professional subjects—medicine, surgery, and the like—at any one of the recognized schools of advanced medical studies The work is somewhat differently arranged, according to whether the student has in view the degrees of the University of London or the diplomas of the Royal Colleges In either case the whole work to be done is divided into courses devised to meet the requirements of different examinations, and students can join the College for any of them Women students are admitted to all courses on the same terms as men The general arrangements for the benefit of students include membership of the Union Society of the Women's Union Society with the College gymnasium and the athletic grounds There is also a collegiate residence for about fifty-five men students at Ealing, and for about seventy women students at Byng Place, Gordon Square

Scholarships—The scholarships and exhibitions obtainable include the Bucknill Scholarship, value 135 guineas, in chemistry, physics, botany, and zoology (the successful student must complete his work at University College Hospital Medical School), and two entrance exhibitions in the same subjects, each of the value of 55 guineas

Fees—The fees for the courses covering the work of the First Examination for medical degrees of the University of London, and in both parts of the Second Examination, amount to 115 guineas The fees for the courses covering the corresponding examinations held by the Conjoint Board in England also amount to 115 guineas These fees may be divided into payments for the different courses which it may be desired to take out, but do not cover tuition for more than a stated period

A handbook specially relating to this faculty may be obtained on application to the Secretary of University College, Gower Street, London, W C 1

THE PROVINCES

THERE are in England and Wales, not counting London, ten medical schools, each supplying instruction in the full medical curriculum Accounts of them here follow In several cases there is appended information concerning hospitals other than those directly connected with the school in question, such hospitals, officially and unofficially, play a part in the education which the students of the school receive, and in any case serve as places of additional or post-graduate study

OXFORD AND CAMBRIDGE

BOTH at Oxford and Cambridge there are medical school which furnish unsurpassed opportunities for obtaining a good knowledge of the preliminary sciences and of anatomy, physiology, and pathology The laboratories are excellently furnished, and the teaching staffs most distinguished Both schools provide a full medical curriculum, and there is no essential reason why the student should not complete his career at either of them, but this is not commonly done The local hospitals, though well equipped, are comparatively small The university authorities therefore encourage the students, as soon as they have completed the earlier examinations and taken a degree in Arts, to join some London school, and thus spend the time of their preparation for the final examinations in a city where the opportunities for gaining clinical knowledge are greater and more varied A considerable proportion of Oxford and Cambridge medical students take the London Conjoint diplomas before graduating in medicine and surgery at their own university

BIRMINGHAM

THE school in this city is carried on by the Medical Faculty of the University of Birmingham, its students having adequate number of good laboratories, classrooms, and other necessaries devoted to their use by the university The clinical work is done at the General and Queen's Hospitals, which are amalgamated for this purpose Together they have upwards of 600 beds for medical, surgical, and special cases, and with an array of special departments of all kinds, including one for lying-in women Clinical instruction is given in the wards and out-patient and special departments daily, and formal clinical lectures delivered weekly throughout the winter and summer sessions Special tutorial classes are also held alike for the degrees of Birmingham and some other universities and for the diplomas of corporations

Appointments—The large number of appointments open to past or other students includes the following —At the General Hospital surgical registrar, £200 a year, one resident medical officer, salary £155 a year, one resident surgical officer, salary £180 a year, one resident pathologist, salary £70 a year, two visiting anaesthetists, salary £50 a year, four house-surgeons, office tenable for nine months, £70 a year, one house-surgeon to the gynecological and one to the special departments, each tenable for six months, £70 a year, three house-physicians, *post tenable* for six months, £70 a year At the Queen's Hospital one medical registrar and one surgical registrar, non-resident, tenable for three years, renewable, salary £100 per annum, three house-physicians, three house-surgeons, and one obstetric and ophthalmic house-surgeon, tenable for six months, salary £70 per annum, with board, lodging, and washing, one casualty house surgeon, tenable for three months, salary £70 per annum, with board, lodging, and washing At the Maternity Hospital one house-surgeon, salary £50 a year At the City Workhouse and Workhouse Infirmary five resident medical officers At the Birmingham General and Branch Dispensaries twelve resident surgeons At the Birmingham Mental Hospitals five assistant medical officers At the City Fever Hospitals three assistant medical officers At the Children's Hospital one resident surgical officer, one resident medical officer At the Birmingham and Midland Eye Hospital four resident surgeons At the Orthopaedic and Spinal Hospital two clinical assistants (non-resident) At the Ear and Throat Hospital one house-surgeon, £70 a year, four clinical assistants (non-resident) Four non-resident Poor Law appointments are in the gift of the Board of Guardians

Scholarships—There are numerous money and other awards for students of sufficient merit among them being the following The Walter Myers Travelling Studentship of £300 offered each alternate year and tenable abroad (next offered in 1925), the Sands Cox Scholarship of £42 (an entrance scholarship in the Faculty of Medicine, awarded on Higher School Certificate Examination of the Joint Matriculation Board (July), four Queen's Scholarships of £10 10s each, awarded annually at the second third fourth and final university examinations respectively, one or more Sydenham Scholarships, allotted on entrance to students who are the sons of deceased medical men the Ingleby Scholarships (two) of £10 for proficiency in midwifery and diseases of women the Arthur Foxwell Memorial Gold Medal (Clinical Medicine) at Final M B examination There is also an entrance scholarship of £37 10s for students proceeding to a degree in dental surgery University Clinical Board Prizes are awarded annually as follows Senior Medical Prize Gold Medal, Senior Surgical Prize, Gold Medal, Midwifery Prize Gold Medal Junior Medical Prize, Silver Medal, Junior Surgical Prize, Silver Medal

Fees—The composition fee for university classes is £106 5s This covers all the work required for the degrees of Birmingham and some other universities and for the ordinary qualifications of licensing corporations but not the additional courses required for the Fellowship of the Royal College of Surgeons of England the diploma and degrees of the university in State Medicine, and some other special work The total cost for the five years' curriculum, including hospital and examination fees, is estimated at £199 2s 6d

Other information should be sought from the Dean of the Medical Faculty, University, Edmund Street, Birmingham

BRISTOL

THE school is carried on by the Faculty of Medicine of the university, and provides full instruction for all its degrees and diplomas

Clinical Instruction.—The allied hospitals (Bristol Royal Infirmary and Bristol General Hospital) have between them about 600 beds and extensive out-patient departments, special clinics for diseases of women and children, and those of the eye, throat, and ear, in addition to large and well equipped departments for dental work and large outdoor maternity departments. At each of these institutions there are well arranged pathological museums, *post-mortem* rooms, and laboratories for morbid anatomy. There are also laboratories for work in clinical pathology, bacteriology, and cytology, in which special instruction is given in these subjects. Departments are provided and well equipped for x ray work, both for diagnosis and treatment, the various forms of electrical treatment, including high frequency currents, electric baths, Finsen light treatment, and massage. The students of the school also attend the practice of the Royal Hospital for Sick Children and Women containing 140 beds, and that of the Bristol Eye Hospital, with 40 beds. The total number of beds available for clinical instruction is therefore about 750.

Appointments.—(1) Undergraduate: Clinical clerkships, *dresserships, also ophthalmic, obstetric, pathological ear*, nose, and throat clerkships, are tenable at the Bristol Royal Infirmary and the Bristol General Hospital. In these institutions the dressers reside in rotation free of charge. (2) Post-graduate: At the Bristol Royal Infirmary four house surgeons, £80 each per annum, two house-physicians, £80, two resident obstetric officers, one of whom is also ophthalmic house surgeon, £100 and £80, ear, nose, and throat house-surgeon, £80, dental house surgeon, £80. All these appointments are made for twelve months. From the resident officers a senior resident officer is appointed at a salary of £200. At the Bristol General Hospital: Senior resident medical officer, £250 per annum, casualty house-surgeon, £80 per annum; two house-physicians, £80 per annum, house surgeon, £80 per annum, special obstetric physician, £80 per annum, house-surgeon to special departments, £80 per annum, dental house-surgeon, £300 per annum. All these appointments are for six months, except that of senior resident medical officer, which is for two years.

Scholarships.—The following are among the scholarships and other awards open to students of the school: The Ashworth Hallett Scholarship, value £45, open to women only; two Martin Memorial Pathological Scholarships of £10 each; the Tibbits Memorial Prize, value 9 guineas, for proficiency in practical surgery; the Committee's Gold and Silver Medals for fifth year students for general proficiency; the Augustin Prichard Prize, value about 6 guineas, for proficiency in anatomy; the Henry Clark Prize, value 11 guineas, for proficiency in gynæcology; the Crosby Leonard Prize, value 7 guineas, for proficiency in surgery; the Suple Surgical Prize, a gold medal and 7 guineas; the Suple Medical Prize, a gold medal and 7 guineas; the Henry Marshall Prize, value £12, for dressers; the H. M. Clarke Scholarship, value £15, for proficiency in surgery; the Sanders Scholarship, value £22 10s., for general proficiency; the Barrett Roué Scholarship for proficiency in diseases of the eye, ear, nose and throat, value £14; Lady Haberfield Scholarship, value about £5 guineas; Phyllis Stepman Prize for proficiency in diseases of children, value £50; Bristol City Senior Scholarships; and the Senior Scholarships offered by the counties of Gloucestershire, Somerset, Wilts, Devon, etc., are tenable in the university.

Some of the Fellowships awarded by the Croston Research Society for research in the university are allotted to the Faculty of Medicine.

Fees.—The fee for all the courses required for the medical curriculum, including hospital practice, is £65 guineas, paid by annual instalments.

UNIVERSITY OF DURHAM COLLEGE OF MEDICINE

THIS, the Medical School of the Faculty of Medicine of the University of Durham, is in the neighbouring city, Newcastle-upon-Tyne. Its classes and lectures are arranged to meet the requirements of the university in all the degrees which the latter grants, and also those of the other examining bodies. The students do their work in the preliminary sciences at Armstrong College, also part of the university, and their clinical work in the Royal Victoria Infirmary, an institution with about 550 beds and special accommodation for the benefit of students. Students do their practical midwifery at the new Princess Mary Maternity Hospital, which was opened by H.R.H. Princess Mary (Viscountess Lascelles) in November last. The hospital, which contains 65 beds, is thoroughly up to date, and there is an annual indoor and outdoor attendance on 3,000 cases. In a Heath wing of the school itself there is the department of physiology. There are also in this wing a gymnasium and a set of rooms for the use of the Students' Union. A new bacteriological department has recently been erected adjacent to Armstrong College.

Students' Union.—Students' Union Buildings are being erected at a cost of about £40,000, and will be opened early in 1925. Separate accommodation (non-residential) is provided for men and women students.

Appointments.—Pathological assistants, and assistants in the eye department, throat and ear department, and department for skin diseases, are elected periodically. Clinical clerks and dressers are appointed every three months.

Scholarships.—University of Durham Entrance Scholarship £25 a year for four years. Pears Entrance Scholarship £40 a year for three years (awarded every third year). Province of Durham Masonic (Entrance) Scholarship £60. Heath Scholarship for surgery £200 available every second year.

The following Scholarships are tenable for one year—namely: Tulloch Scholarship for elementary biology and organic chemistry £20. Dickinson Scholarship for medicine, surgery, midwifery and pathology, Gold Medal and £20. Charlton Scholarship for medicine, £25. *Gibb Scholarship for pathology* £23. Luke Armstrong Scholarship for comparative pathology £25. Stephen Scott Scholarship for surgery £40. Philipson Scholarships for highest marks in Final M.B., B.S. Examinations, two of £43 each. Goyder Memorial Scholarship for clinical medicine and clinical surgery, interest on £325. Gibson Prize for midwifery and diseases of women and children £10. Turnbull Prize and Silver Medal for surface anatomy and Outterson Wood Prize for psychological medicine, £10. At the end of each session a prize of books is awarded in each of the regular classes.

Fees.—The composition fee for lectures at the college is £122. Composition fee for hospital practice £46 *plus* £2 2s. yearly for three years, payable to the *Committee of the Royal Victoria Infirmary*. Other information should be sought from the Registrar of the College of Medicine at Newcastle.

LEEDS

THE School of Medicine—which is open to both male and female students—in this city forms the teaching centre of the Medical Faculty of the University of Leeds, and is situated in immediate proximity to the General Infirmary, where students sufficiently advanced receive their clinical instruction. The buildings were opened in 1894, and contain excellent dissecting rooms, several well arranged laboratories for physiology, pathology, and bacteriology, three lecture theatres, and several similar classrooms. In addition, there are a library and reading room and two museums, one being devoted to pathology and the other to anatomy. The comfort of the students is secured by common rooms and a refectory in which they can take meals. The General Infirmary has 632 beds and includes gynæcological and ophthalmic wards, a special children's ward, and a large out-patient department. The Ida and Robert Arthington Semi-convalescent Hospitals, Cookridge, a tached to the Infirmary, have 28 beds. The West Riding Mental Hospital at Wakefield is also open for the study of mental diseases. Students can, in addition, attend the practice of the Leeds Public Dispensary, the Hospital for Women and Children, and the Leeds Maternity Hospital, where the obstetric work is done.

Appointments.—One senior anæsthetist, £50, seven anæsthetists, £25 each, one resident medical and one resident surgical officer, each at £150 per annum; one casualty officer, at £125 per annum; one resident ophthalmic officer, at £100 per annum; one resident aural officer, at £100 per annum; one resident orthopædic officer, at £150, one ophthalmic house-surgeon, and one resident obstetric officer, at £50 per annum; four house-physicians, each holding office for six months, and four house-surgeons, holding office for six or twelve months. Surgical dressers are appointed every six months; physicians' clerks, ophthalmic and aural dressers, gynæcological ward clerks, gynæcological out-patient clerks, maternity clerks, assistant physicians' clerks, dermatological clerks, and assistant surgeons' dressers, dressers in the casualty room, *post-mortem*

clerks, and laboratory assistants every three months, and dressers in the venereal clinic every month A resident medical officer (honorarium at rate of £30 per annum) is also appointed every six months for the Ida Semi-convalescent Hospital Appointments are also open to students at the Leeds Public Dispensary (four resident medical officers), at the Hospital for Women (two house-surgeons, at £50 per annum, and two anaesthetists, £20), and at the West Riding Asylums

Scholarships.—The university awards annually a scholarship in the form of a free admission to the lectures and classes given in the university, which are covered by the composition fee The university also awards a scholarship on the results of the first examination, of the value of £68, in the form of a free admission to the clinical teaching of the infirmary

Fees.—It is estimated by the authorities that the approximate cost of medical education to a student in this university is £300 *plus*, of course, the expenses of living during the five years covered by the curriculum The fee for a complete course for the First M B is £41, the composition fee for the course for the second and third examinations, and for the clinical work at the infirmary, is £174 The composition and clinical fee for those who have passed the second examination is £138

Further information can be obtained from the Academic Subdean or Clinical Subdean, School of Medicine, Leeds

---

LIVERPOOL

THE Medical School of this city is part of the university, and, owing to the enlightened liberality of several men of wealth, is exceptionally well provided with special laboratories, as well as with ordinary spacious and well equipped classrooms and laboratories for the instruction of students proceeding to medical degrees and diplomas in special and ordinary subjects All the laboratory and other rooms are situated close to one another and intercommunicate, together forming large blocks of buildings The work of students throughout all stages of their career is arranged upon very satisfactory lines, and the teaching hospitals, of which an account is given below, have amalgamated to form the clinical school of the university

Appointments.—The nature of the appointments open to past and other students at this school will be gathered from the account which follows of the hospitals forming its clinical department

Scholarships.—The awards made each year to successful students total over £1,500 They include the following Two Holt Fellowships, one in Pathology, the other in Physiology, a Robert Gee Fellowship in Anatomy, two John Rankin Fellowships in Anatomy, a John W Garrett International Fellowship in Bacteriology a Johnston Colonial Fellowship in Biochemistry an Ethel Boyce Fellowship in Gynaecology, and a Thelwall Thomas Fellowship in Surgical Pathology one Lady Jones Fellowship in Orthopaedic Surgery, one University Fellowship (value of Fellowships one at £200, three at £150 two at £120 five at £100), a University Scholarship of £25 awarded on the results of the Second M B Examinations, a Scholarship in Mechanical Dentistry of £20, two Lyon Jones Scholarships, of the annual value of £21 each for two years, one for the junior and the other for the senior students, the Derby Exhibition of £15, the Clinical School Exhibition of £15, the Owen T Williams Prize the Tom Gold Medal in Anatomy, John Rankin Exhibition in Practical Anatomy, £25 the George Holt Medal in Physiology the Kanthack Medal in Pathology, Mitchell Banks Medal in Anatomy, the Robert Gee Prize of £5 5s in Children's Diseases, Mary Burrell Davies Memorial Scholarship, £60 per annum for four years two Robert Gee Entrance Scholarships, each of the value of £25 per annum for two years, Dental Operating Prizes (four), Orthodontia Prizes (two) Samuels Memorial Scholarships three at £20 each one Thomas H Bickerton Prize in Anatomy, Dr N L Robert Prize in Zymotic Diseases, Ash's Prize in Dental Surgery, value £2 2s Gilmour Medal, and other entrance scholarships

Fees.—Information as to the fees for the courses of instruction provided by the schools should be sought from the Dean of the Medical Faculty

The Clinical School

As many as ten hospitals have combined to form the clinical school of the university, these being The Royal Infirmary, the David Lewis Northern Hospital, the Royal Southern Hospital the Stanley Hospital, the Royal Liverpool Children's Hospital, the Hospital for Women, the Liverpool Maternity Hospital and Ladies' Charity, the Eye and Ear Infirmary, St Paul's Eye Hospital, and St George's Hospital for Diseases of the Skin Between them they provide about 1 445 beds

MANCHESTER

THE staff of the Medical School in this city constitutes the Medical Faculty of the Victoria University, all the arrangements for the instruction of students, both in their earlier and their later studies, being of an elaborate nature The clinical work of the undergraduates is done chiefly in connexion with the Royal Infirmary, an institution which itself contains about 671 beds, and has associated with it a large convalescent home (136 beds), and the Mental Hospital at Prestwich Instruction in practical gynaecology and midwifery is given at the Royal Infirmary and the St Mary's Hospitals

Appointments.—The following are among the appointments open to past and present students of this school in connexion with its arrangements for clinical tuition A surgical registrar, at £150 per annum, a pathological registrar, at £350 per annum, two medical registrars, at £150 per annum, a surgical tutor, at £30 per annum, a director of the clinical laboratory, at £400 per annum, and one assistant director at £300, three assistant medical officers and three assistant surgical officers, each at £35 per annum, two assistant surgical officers, aural department, at £35 per annum, seven anaesthetists, from £75 to £100 per annum each, one radiological registrar, at £250 per annum, one resident medical officer, one year, £250 per annum, ditto at Royal Lunatic Asylum, Cheadle, one year, £300 per annum, one resident surgical officer, one year, £250 per annum, two resident medical officers for Central Branch, £200 and £100 per annum, one assistant resident surgical officer, six months, £200 per annum, one assistant medical officer at the Convalescent Hospital at Cheadle, appointed every six months, at a salary of £80 per annum, ten senior and ten junior house-surgeons and ten house-physicians, appointed during the year for a term of six months, at a salary of £50 for the first six months, and £100 for the second six months Resident officers are appointed to the gynaecological, the eye, and the ear and throat departments every three months Clinical clerks and surgical dressers are appointed to the various departments of the hospital every three months

Entrance and other Scholarships.—The following are among the scholarships obtainable by students of the school Rogers and Sexton Scholarships in Arts (in alternate years) £40 per annum, tenable for two years Derby Entrance Scholarship in Mathematics, tenable for one year, value £25 one being awarded annually, except in such years as a Cutwright Scholarship is awarded Cutwright Scholarship, £35 per annum, tenable for three years, three Hulme Scholarships tenable for three years, of £35, one being awarded annually for proficiency in subjects of general education Two James Gaskill Scholarships of £35, tenable for two years, one being awarded annually for of mechanics and chemistry A Dora annum, tenable for three years, and of women students only This is awarded triennially Sir J P Kay Shuttleworth Scholarship, £30 per annum tenable for three years awarded triennially, open to the competition of scholars from Sedburgh School, Giggleswick School, and Burnley Grammar School Subjects mathematics, chemistry, and mechanics Dreschfeld Memorial Scholarship, value £20, tenable for two years and awarded triennially on the result of the Entrance Examination A Theodores Modern Languages Exhibition, £20, awarded annually Two Dauntesey Medical Scholarships, value £45 and £35 tenable for one year, for candidates who have not ond year of study leading to a medical zoology, botany and chemistry Two En Medicine, value 160 guineas, awarded annually for proficiency in Arts or Science respectively One Research Scholarship in Public Health of £100, awarded annually Tom Jones Exhibition in Anatomy, £25 offered annually A Robert Platt Physiological Scholarship of £90, tenable for one year A Leech Fellowship of £100 for original research after graduation A Graduate Scholarship in Medicine, value £25, tenable for one year awarded annually for proficiency shown at Final M B Examination A Dumville Surgical Prize, value £15 awarded annually at graduation The Tom Jones Memorial Surgical Scholarship value £60 tenable for one year, usually awarded annually The Turner Medical Prize value £20 awarded annually for proficiency in certain subjects of the Final M B Ch B Examination The John Henry Agnew Scholarship of £30, awarded annually for proficiency in the Diseases of Children The Ashby Memorial Scholarship tenable for one year (£100), for research in the Diseases of Children, offered triennially Sidney Renshaw Exhibition in Physiology one offered annually The details and kinson Scholarships—(1) for Anatomy, (2) search Scholarship in Surgery and (4) Travelling Scholarship in Medicine—may be obtained from the Secretary to the Trustees The Sam Gamble Scholarships—the trustees are prepared to award four scholarships of not less than £40 per annum tenable for not more than four years to women students who have passed the

First M B Examination the conditions can be obtained from the Registrar The Knight Prize of £50 for original research in the psychological factors in the causation of mental disorder—open to holders of the Diploma in Psychological Medicine or medical practitioners who have been registered in the university as candidates for that diploma

Fees—The composition fee for the university course in medicine is 104 guineas, payable in four instalments of 26 guineas but this sum does not include the fee to cover the work required for the First M B Examination This is 36 guineas payable in one sum Hospital fees are additional, and usually amount to about 77 guineas.

A prospectus and further information about the school and scholarships may be obtained from the Registrar

Clinical Work—The Royal Eye Hospital, the Hospital for Diseases of the Skin, the Manchester Northern Hospital for Women and Children, the well known Hospitals for Children at Pendlebury, and St Mary's Hospitals for Women and Children, all make arrangements for the instruction of students

SHEFFIELD

In this city the medical school is one of the departments of the university, being conducted and controlled by its Medical Faculty, and occupying practically the entire north wing of the quadrangle of the university buildings overlooking Weston Park The laboratories and lecture rooms connected with the subjects of the first and second examinations—namely, chemistry, physics, biology, anatomy, and physiology—are, both as regards structural arrangement and scientific equipment, on the most modern and complete lines

For students of pathology and bacteriology there are laboratories replete with everything necessary for the most advanced work, and a large pathological museum which is open daily In addition, there is a museum devoted to materia medica specimens and a large library and reading room There are a number of recreation, athletic and other societies, all under the management of an annually elected students' representative council, and large and comfortable common rooms both for men and women students There are also two student unions—one for men and one for women students In the university buildings there is a refectory open to all students of the school, and a university journal is published each term The ordinary clinical work of the school is done at the Royal Infirmary and Royal Hospital, which have amalgamated for the purpose of clinical instruction, and provide over 500 beds for medical, surgical, and special cases, including diseases of the eye

In addition, the Royal Infirmary has special departments for the treatment of diseases of the skin and ear, with beds assigned to them, whilst at the Royal Hospital there are special out-patient departments for diseases of the throat ear, skin, orthopaedics, and mental diseases The medical and surgical staffs attend daily, and give clinical instruction in the wards and out-patient rooms Clinical lectures in medicine and surgery are given weekly Instruction in the practical administration of anaesthetics is given at either institution by the anaesthetists, and the *post-mortem* examinations at both institutions are in charge of the Professor of Pathology, and afford ample material for study of this subject Students are able to attend the practice of the Jessop Hospital for Diseases of Women and the Hospital for Sick Children, while special courses on fever are given at the City Fever Hospital, and on mental diseases at the South Yorkshire Asylum

Appointments—The following appointments are open to all students who have passed their examinations in anatomy and physiology (1) Casualty dresserships, (2) surgical dresserships, (3) medical clerkships, (4) pathological clerkships, (5) ophthalmic clerkships (6) clerk to the skin department, etc These appointments are made for three months, commencing on the first day of October, January, April and July

Scholarships—Entrance Medical Scholarship value about £100 open to both sexes Six Edgar Allen scholarships of £125 a year for three years may be held by students taking the degree course in Medicine Two Town Trustees Scholarships each of the value of £50 tenable for three years for boys or girls under the age of 19 years who have been educated in a Sheffield secondary school for a period not less than two years immediately preceding the examination Four Town Trustees Scholarships value £50 each tenable for one year by boys or girls under 19 years of age educated in any school in Sheffield secondary or otherwise Town Trustees Fellowship value £75 tenable for one year Mechanics Institute Fellowship value £50 (with remission of fees) tenable for one year and renewable for a second year The Frederick Clifford Scholarship value about £50 tenable for two years Kaye Scholarship for proficiency in anatomy and physiology value £22 10s Gold and bronze medals are also awarded for proficiency in various subjects

Fees—Students in the Faculty taking the complete medical course in the university pay an inclusive composition fee of £52 for each of the five years Students taking a complete dental course pay a composition fee of £26 at the beginning of each year of the course In addition a fee of £50 is payable each year the student receives instruction in Mechanical Dentistry in the Dental Department The fees for special courses taken separately can be ascertained by inquiry of the Dean

WELSH NATIONAL SCHOOL OF MEDICINE, CARDIFF

THIS school is staffed on the Unit system, and its courses of instruction are open to both men and women students

Students can complete the whole of their curriculum in the school and qualify for the degrees of M B, B Ch in the University of Wales, and the M B, B S in the University of London Students can also qualify for the Diploma of the Conjoint Board in England Hospital instruction is given at the Cardiff Royal Infirmary, at the City Lodge Hospital, and at other recognized institutions The attention of students about to matriculate is drawn to the numerous entrance scholarships offered for competition at the University College, Cardiff, most of which may be held by medical students Full particulars of the examination for these may be obtained by application to the Registrar Medical men wishing to prepare for the Diploma in Public Health or the Tuberculous Diseases Diploma of the University of Wales can attend complete courses of instruction in the school Prospectuses can be obtained on application to the Dean of the Faculty of Medicine, or to the Secretary, at University College, Cardiff

SCOTLAND

As will be gathered from the following paragraphs, the facilities for acquiring a medical education in Scotland are very ample, whether the student be proceeding to a university degree or to a diploma To the descriptions of the different Scottish medical centres is in some cases added an account of hospitals which either play an official part in the education given to students as yet unqualified, or offer valuable opportunities for post-graduation work

ABERDEEN

THE school is conducted by the Faculty of Medicine This comprises twelve chairs, from which instruction is given in all the main branches of medical science—namely, botany, zoology, physics (ordinary and pre-registration), chemistry (ordinary and pre-registration), anatomy, physiology, materia medica, pathology, forensic medicine, surgery, medicine, and midwifery Courses of instruction in public health and infectious diseases, tropical medicine, medical ethics, and sanatorium treatment of tuberculosis, are conducted by lecturers appointed by the University Court Special opportunities for practical instruction are afforded in the laboratories and museums attached to the departments

Clinical instruction is obtained in the Royal Infirmary (accommodating 270 patients), the Royal Mental Hospital (900 patients) the Sick Children's Hospital (65 patients), the City Fever Hospital (250 patients) the General Dispensary, Maternity, and Vaccine Institution (10 000 out-patients annually), and the Ophthalmic Institution (3 000 patients annually) Courses of practical instruction are given in diseases of children at the Sick Children's Hospital in fevers at the City Fever Hospital, in mental diseases at the Royal Mental Hospital, in diseases of the ear, nose, and throat at the Infirmary and Dispensary in diseases of the eye at the Infirmary and Eye Institution in venereal diseases and diseases of the skin at the Royal Infirmary

The degrees granted in medicine are Doctor of Medicine (M D), Master of Surgery (Ch M), Bachelor of Surgery

and Bachelor of Medicine (M B, Ch B) A Diploma in Public Health is conferred after examination on graduates in medicine in any university of the United Kingdom

The degree of Ph D is also granted in this faculty

Bursaries, Scholarships, and Fellowships, to the number of fifty and of the annual value of £1,180, may be held by students of medicine in this university They range from £8 to £100 per annum, and are tenable in most cases for two or three years The winter session begins on October 13th, 1924, the summer session on April 21st, 1925

Fees—An inclusive fee of 126 guineas is payable for instruction within the university, and the fee for the degrees of M B, Ch B is 33 guineas The total cost, including hospital fees, class and matriculation fees, and degree fees, is about £240

EDINBURGH

THERE are two Schools of Medicine the School of the University, and the School of Medicine of the Royal Colleges of Physicians and Surgeons of Edinburgh

THE UNIVERSITY SCHOOL—This school, in addition to other resources of the university, has the following means of affording practical instruction Royal Botanic Garden, Herbarium, and Museum, Zoological Laboratory and Museum of Science and Art, Physical Laboratory, Chemical Laboratories, Dissecting Room, Bone Room, and Anatomical Museum, Physiological Laboratory, Medical Jurisprudence Laboratories, John Usher Institute of Public Health, Materia Medica Museum and Laboratory, *Post-Mortem* Department of the Royal Infirmary and University Pathological and Bacteriological Laboratory, Tutorial Classes of Practice of Physic, of Clinical Medicine, and Clinical Surgery, Surgery and Midwifery, and the practice of certain other hospitals

Fees—The sessional fee for chemistry, anatomy lectures, physiology, pathology, materia medica, surgery, medicine, and midwifery is £6 6s each Physics, botany, zoology, forensic medicine, and public health, £5 5s Practical zoology, practical anatomy (summer), morbid anatomy, practical materia medica, mental diseases, practical pathology and medical entomology and parasitology, £4 4s Experimental physiology, diseases of tropical climates, practical botany, histology operative surgery, clinical surgery (per term), and experimental pharmacology, £3 3s Practical anatomy (winter), £6 16s 6d Clinical medicine, £3 13s 6d first term, subsequent terms £3 3s Practical chemistry, £4 14s 6d Regional anatomy, chemical physiology, surgical pathology, applied anatomy, and infectious diseases £1 11s 6d Tuberculosis, diseases of children, diseases of the eye, diseases of the larynx, ear, and nose diseases of the skin and venereal diseases, £2 12s 6d Advanced bacteriology, £7 17s 6d Clinical gynaecology, £2 2s

Scholarships—There are many funds for the assistance of students by means of bursaries, scholarships, exhibitions, and money awards from the beginning to the end of their undergraduate career In addition there are funds which help those who have taken a first degree in medicine and surgery to continue at work as research students The value of these awards, and the conditions attaching to them, are so varied that those interested should consult the prospectus of the school itself No other university is in a better, even if as good, a position to smooth the financial path of earnest students

THE SCHOOL OF MEDICINE OF THE ROYAL COLLEGES—This school is composed of lecturers licensed by the Royal College of Physicians and the Royal College of Surgeons, and also recognized by the university through their *licentia docendi*, for the sake of convenience they lecture in separate buildings near to the Royal Infirmary, but form a single corporate body governed by a board consisting of five members elected by the Royal College of Physicians, five members elected by the Royal College of Surgeons, and five members elected by the lecturers in the school This board, with the assistance of the standing committees of the school, supervises the whole management and especially the maintenance of the efficiency and discipline of the school The different buildings at present utilized for the purposes of lecturing are the following (1) Surgeons' Hall, Nicolson Street, (2) New School, Bristo Street, (3) Nicolson Square, (4) Marshall Street, and other places The teaching is similar to that of the Scottish universities, and the students receive similar certificates at the close of each session The courses on the special subjects not included in the curriculum of the Examining Boards are also conducted by teachers specially qualified in each branch, and have for the last quarter of a century formed a special feature of the school The fees payable for class and other instruction, and including the sums payable on admission to the examination of the Conjoint Board for the triple qualification, amount to about £180 The Calendar, giving full information regarding classes and fees, can be obtained (price 6d) on application to the Dean of the School, 11, Bristo Place, Edinburgh

WOMEN STUDENTS IN EDINBURGH—Until the close of the summer session of 1916 women students intending to proceed to graduation in the University of Edinburgh, as well as those entering for the triple qualification of the Royal Colleges of Edinburgh and Glasgow, received their training in the Edinburgh School of Medicine for Women Now women students study under the same conditions as men, and may obtain either the university degree or the diploma of the Royal Colleges In the university systematic lectures are given to them by the professors in the ordinary classes, which are therefore mixed In Clinical Medicine and Clinical Surgery, however, while the lectures are attended by mixed classes, the women students are restricted to the wards of one charge The particular wards are changed every session, each of the physicians and surgeons to the Infirmary taking the women students in rotation With few exceptions, prizes, scholarships, bursaries, and similar distinctions are open to women under the same conditions as for men The women students also have the same privileges as in the past have been given to the men of attending a certain proportion of the extramural classes taught by the lecturers of the School of Medicine of the Royal Colleges Most of the Students' Societies are open to women, with the exception of the University Union and the Royal Medical Society Their place is taken by the Women Students' Union and the Women's Medical Society There is also a Women's Athletic Club, with playing fields gifted to it by the university Information on matters connected with women's studies may be obtained from the Lady Warden, University New Buildings, Edinburgh

GLASGOW

THE UNIVERSITY SCHOOL FOR MEN—The whole course of study required for graduation (M B, Ch B) at the University of Glasgow can be taken here Besides ample provision for lectures there is practical and clinical work at the hospitals, and practical courses are conducted in the laboratories of the following departments Surgery, Pathology, Public Health, Pharmacology, Physiology, Anatomy, Chemistry, Zoology, Physics, and Botany, the Botanic Garden and the Hunterian Museum (Zoology and Pathology) are also open to students New buildings and equipments have been provided for botany, zoology, for practical anatomy, for operative surgery, as well as for pathology, the very large additions made a number of years ago to the chemical laboratory rendered it one of the most extensive in Scotland The classrooms and laboratories for the departments of Physics, Physiology, Pharmacology, Materia Medica, Medical Jurisprudence, and Public Health are also of recent erection, and are elaborately equipped Four additional chairs of Medicine, Surgery, Obstetrics, and Pathology have been recently established, the professors being specially attached to the Royal Infirmary, and a number of university lectureships in Clinical Medicine, Clinical Surgery, Venereal Diseases, Laryngology, Dermatology, Otology, Psychological Medicine, Tuberculosis, and Electrical Diagnosis and Treatment have been founded there Five other chairs have been founded at the university, in Bacteriology, Organic Chemistry, Physiological Chemistry, Applied Physics, Public Health, and another in Pediatrics There are also lectureships on the Surgical and Medical Diseases of Children and on Electrical Diagnosis and Therapeutics The university, in short, has made great and successful efforts to extend and improve the accommodation of the medical departments, to strengthen the teaching staff and to encourage post-graduation and research work Three very extensive general hospitals in the city afford exceptional opportunities for clinical instruction—namely, the Western Infirmary (600 beds), near the university, to which the Regius Professors are attached, the Royal Infirmary (630 beds), and the Victoria Infirmary (260 beds) while the Royal Mental Hospital Gartnavel (460 beds), the Royal Hospital for Sick Children (200 beds), the Royal Maternity and Women's Hospital

(108 beds), the Glasgow Eye Infirmary (100 beds), the Ophthalmic Institution (35 beds), the fever hospitals at Belvidere (680 beds), and Puchill (540 beds), and other institutions afford facilities for the practical study of special branches. The large general hospitals of the parish council are now also available for clinical instruction in Medicine and Surgery. Information regarding post-graduate study will be found at page 435.

Bursaries.—Bursaries connected to the Medical Faculty amount in annual value to about £1,600, while bursaries in any faculty amounting to about the same annual sum may be held by students of medicine; a number of both sets being open to women. Several valuable scholarships may be held by medical students who have graduated in Arts.

The following bursaries are open to undergraduates of both sexes. The Gibson Bursary, annual value £36, tenable for four years. This is open to medical students who are preparing for service as medical missionaries in connexion with the Church of Scotland, and will be awarded to the eligible candidate who has gained the highest number of marks in the First Professional Examination. The Arbroath Bursary, annual value £40, tenable for three years, is awarded by the Senate on the recommendation of the Faculty of Medicine to the student who is of the highest merit among the candidates as shown by their class records and their performances in the First and Second Professional Examinations. One Logan Bursary, annual value £16, tenable for four years, appointment by the Senate. Six Lorimer Bursaries (each £20 and tenable for one year) are awarded to the best students in each of the following classes: botany, zoology, physics, chemistry, anatomy, physiology. The Macintosh Mental Science Bursary in medicine of the value of £31 is awarded annually to the student (of either sex) attending the class of insanity who stands first in an examination in that subject, the bursar to continue the practical study of the subject to the satisfaction of the Faculty of Medicine. The Gardiner Bursary, annual value £14, tenable for two years, will be awarded after the autumn professional examination to the candidate who has passed in physiology at the *Second Professional Examination and whose aggregate of marks* in that subject and in chemistry and physics of the First Professional Examination is the highest. Of the eight James A. Paterson Bursaries two are awarded each year, there are of the value of £30 and £20 respectively, and are tenable for four years. Examination in mathematics and natural philosophy in June for students entering the first and second year of medical study. The following are tenable in any faculty. *Four Nelson Bursaries* (each £75 and tenable for four years) two Pratt Bursaries (each £20 and tenable for four years) and two Taylor Bursaries (each £10 and tenable for four years). Andrew and Bethia Stewart Bursaries (£50 each, tenable for three years) candidates must have taken the M.A. degree of Glasgow. There is a special examination. Nine Glasgow Highland Society's Bursaries for students of Highland descent of the annual value of £25 and tenable for five years, two vacant each year.

The Carnegie Trust for the Universities of Scotland is empowered to pay the whole or part of the university ordinary class fees of students of Scottish birth or extraction under conditions given in the *University Calendar* and summarized at page 414 of this issue. The Dobbie Smith Gold Medal is awarded for the best essay on a prescribed subject within the science of botany. The Brunton Memorial Prize of £10 is awarded annually to the most distinguished graduate in medicine of the year. The University Commissioners issued an ordinance to make regulations for the admission of women to certain bursaries, scholarships and fellowships. Scholarships and fellowships are offered by the Carnegie Trust in science and medicine for post-graduation study. There are also four McCunn Medical Research Scholarships (two of £205 and two of £400) for graduates in medicine of the Scottish universities; one Faulds Fellowship for Research in Medical Science of approximately £200 for three years, and one Strang Steel Scholarship value £160 for one year. There is in addition the Captain H. S. Rankin V.C. Memorial Prize in Pathology.

Fees.—*The matriculation fee for each year* is £2 2s. In most cases the fee for each university class is £6 6s., but in some cases it is £4 4s. For hospital attendance students pay an entrance fee of £7 at the Western Infirmary with an additional fee of £5 5s. for each winter and £2 12 6d. for each summer clinical course at the Royal Infirmary the fees are somewhat similar. The university fee for the four professional examinations is £34 13s. For the whole curriculum the fees for matriculation, class attendance, hospital attendance and professional examinations amount to about £225.

For further information apply to the Registrar, Glasgow University.

QUEEN MARGARET COLLEGE.—*In this, the Women's Medical* School of the University of Glasgow, the courses of study, degrees, regulations, fees, etc., are the same as for men. Women students have their own buildings, with classrooms, reading room, library, etc. They are taught in some classes apart from male students, in others together with them, but in either case have all the rights and privileges of university students. Their clinical studies are taken in the Royal Infirmary, where wards containing 520 beds are available for their use, and in its dispensary, and similarly in the Western Infirmary and in the Victoria Infirmary, also in the Royal Hospital for Sick Children, the Glasgow Ear Hospital, the Royal Asylum, Gartnavel, Hartheid Asylum, the Ophthalmic Institution, the City of Glasgow Fever Hospitals, Belvidere and Puchill, and the Glasgow Royal Maternity and Women's Hospital.

Scholarship.—The Arthur Senolar hip, annual value £20, tenable for three years. Open to competition by medical students of first year at the First Professional Examination in October 1925. The scholarship is restricted to women medical students.

Full information can be obtained from the Mistress, Queen Margaret College, Glasgow.

Board for Students.—A house of residence for women students, Queen Margaret Hall, is situated near the college, in Bute Gardens. The cost of board and residence is from 27s. to 32s. 6d. a week, according to accommodation. Applications to be made to the Lady Superintendent. Another hostel near the college is South Park House, Ann Street, belonging to the Student Christian Movement and open to women students of all colleges in Glasgow. Cost of board is from 22s. to 30s. weekly. Applications to be made to the Warden.

ST MUNGO'S COLLEGE.—This is the Medical School of the Royal Infirmary, which is the largest general hospital in Glasgow. The infirmary is situated in Cathedral Square, Castle Street, and has easy communication with every part of the city. St Mungo's College is in the infirmary grounds, and affords full courses in all the subjects of the medical curriculum, and in all the medical subjects of the dental curriculum.

The infirmary has (including the ophthalmic department) *over 700 beds, the average number occupied in 1920 being over 600. There are special beds and wards for diseases of* women, of the throat, nose, and ear, venereal diseases, burns, and septic cases. In the out-patient department the attendances in 1921 numbered 168,610. In addition to the large medical and surgical departments, there are departments for special diseases—namely, diseases of women, of the throat and nose or the ear, or the eye, or the skin, and of the teeth. There is also a fully equipped electrical pavilion, with the latest and most approved apparatus for diagnosis and treatment.

Appointments.—Five house physicians and eleven house surgeons, who must be fully qualified, are appointed every six months, and board in the hospital free of charge. Clerks and dressers are appointed by the physicians and surgeons. As many cases of acute diseases and accidents of a varied character are received, these appointments are very valuable.

Fees.—The average class fee is £3 3s. for summer classes and £4 4s. for winter classes. The fees for all the lectures, practical classes and hospital attendance necessary for candidates for the diplomas of the English or Scottish Colleges of Physicians and Surgeons amount to about £60. The classes are open to male and female students.

A syllabus of classes can be obtained on application to the Secretary to the Medical Faculty, St Mungo's College, 86, Castle Street.

THE ANDERSON COLLEGE OF MEDICINE.—This school provides education in all subjects of the curriculum for both medical and dental students. The school buildings are situated in Dumbarton Road, immediately to the west of the University and Western Infirmary. The hospital practice and clinical lectures are provided in the Western or Royal Infirmary, pathology in the Western or Royal Infirmary, vaccination and dispensary practice in the Western or Royal Infirmary Dispensary. These classes are recognized by all the licensing corporations in the United Kingdom also by the Universities of London, Durham, Glasgow, and Edinburgh (the latter two under certain conditions stated in the School Calendar). The courses (lectures and laboratory) in public health are recognized by the Scottish Licensing Board, the Universities of Oxford, Cambridge, and London, and the London and Irish Colleges.

Fees.—The fees for the lectures and practical work required by ordinary students range between 2 and 5 guineas a session. In the Public Health Department the fee for a six months' course is £15 15s. The Carnegie Trust pays the fees of students at Anderson College on condition regarding which particulars may be obtained from the Secretary, Carnegie Trust Offices, Edinburgh.

A Calendar will be sent on receipt of a postcard by the Secretary to the Medical Faculty, the Anderson College of Medicine, Glasgow, W, who will forward any further information which may be desired

The Royal Samaritan Hospital for Women, Glasgow, with over 90 beds, offers facilities for clinical instruction in the diseases peculiar to women Particulars may be obtained from T Mason Macquaker, M A, honorary secretary, 149, St Vincent Street, Glasgow

ST ANDREWS AND DUNDEE

THE medical departments in these two teaching centres cater specially for students proceeding to the degrees of the University of St Andrews, but admit other students as well *In the former city the United College provides* education in all subjects for the first two years In Dundee, University College provides for the needs of students from the beginning to the end of the five years' curriculum Its buildings are modern, and contain fully equipped laboratories The clinical work of the school is facilitated by various institutions The class fees are from £6 6s to £5 12s 6d for systematic classes, and from £4 14s 6d to £4 4s for practical classes The hospital ticket is £1 8s for three months, £4 4s a year, or perpetual, £13 6s 8d in one sum The inclusive or composition fee for the curriculum is £182 In connexion with both institutions there are bursaries and scholarships of considerable value, which are awarded after competitive examination Information as to these can be obtained from the Secretary of the University of St Andrews Information regarding the clinical facilities may be obtained from the Dean of the Medical Faculty, Medical School, Dundee

Clinical Work

Good opportunities for clinical work are afforded by the Dundee Royal Infirmary, the instruction given thereat being recognized for purposes of graduation by all the Scottish Universities, the University of Cambridge, the University of London, the National University of Ireland, and by the Royal Colleges of England and Scotland

IRELAND

THERE is a choice of six schools for those pursuing their medical studies in Ireland For clinical instruction the choice is equally satisfactory and varied, though the hospitals themselves are comparatively small Some account of the schools follows

DUBLIN

School of Physic

THIS school is in Trinity College, Dublin, and is carried on under the joint auspices of the University of Dublin and of the Royal College of Physicians of Ireland, the King's professors of institutes of medicine (physiology), practice of medicine, materia medica, and midwifery being appointed by the latter Clinical instruction is given at Sir Patrick Dun's Hospital, and some twelve other metropolitan hospitals and asylums are recognized by the Board of Trinity College The courses of instruction are open to all medical students, whether they belong to the university or not

The Schools of Surgery

These are schools carried on in Dublin under the supervision and control of the Council of the Royal College of Surgeons They are formed of the College's own school, combined with two famous old medical schools—Carmichael and Ledwich, they are attached to the College by charter The buildings contain spacious dissecting rooms, special pathological, bacteriological, public health, chemical, and pharmaceutical laboratories Advantage can be taken of the lectures and instruction afforded by students otherwise unconnected with the College

Prizes—Among the prizes annually awarded are The Barker Anatomical Prize (£26 5s) the Carmichael Scholarship (£15), the Mayne Scholarship (£8), the Gold Medal in Surgery, the Stoney Memorial Gold Medal in Anatomy the H Macnaughton Jones Gold Medal for Midwifery and Gynaecology class prizes accompanied by silver medals will also be given in each subject

A prospectus can be obtained post free on application to the Registrar, Royal College of Surgeons, Dublin

University College, Dublin

This is one of the constituent colleges of the National University of Ireland, and at present conducts its work at buildings on St Stephen's Green It possesses a good library, and the arrangements for the teaching of medical students from beginning to end of the curriculum are adequate Applications for other information may be addressed to the Secretary and Bursar, University College, Dublin

Clinical Work

There are numerous well arranged hospitals in and around the city, and almost all of these are recognized for teaching purposes by the Conjoint Board of Ireland, the University of Dublin, the National University of Ireland, and by like bodies elsewhere in the British Isles Among them are the Mater Misericordiae Hospital, with 345 beds, Dr Steevens's Hospital at Kingsbridge, with 150, Meath Hospital and County Dublin Infirmary, with 160, Mercer's Hospital, close to Trinity College, with 120, the Royal City of Dublin Hospital, with 124, the Adelaide Hospital, with 140, the Royal Victoria Eye and Ear Hospital, with 100 beds, Sir Patrick Dun's, which has a direct connexion with the School of Physic, and the combined institutions formed by the Hardwicke Fever Hospital, the Richmond Surgical Hospital, and the Whitworth Medical Hospital, with an aggregate of 230 beds

As for the famous Dublin medical institution known as the Rotunda Hospital, this practically consists of two distinct hospitals, and is believed to be the largest combined maternity and gynaecological hospital in the British Isles It receives nearly 3,000 patients every year, and, apart from ordinary out-patient work of a gynaecological order, annually attends some 2,000 women *at their own homes* during their confinement It possesses residential quarters for students, and, taken as a whole, offers exceptional opportunities for study both to ordinary students and to medical graduates of any nationality

BELFAST

THE Medical School is part of the Faculty of Medicine of Queen's University, Belfast, and provides a complete medical curriculum for all purposes The laboratories in connexion with the departments of biology, chemistry, physiology, pathology, anatomy, physics, and materia medica are all excellent, and there is a Students' Union which gives students the advantages of dining rooms, reading rooms, a library, and various recreation rooms Women are eligible as students Clinical instruction is given at the Royal Victoria Hospital, which was rebuilt a few years ago and has 300 beds, and the Mater Infirmorum Hospital, which has 150 beds Other hospitals open to the students of the university are the Maternity Hospital, the Ulster Hospital for Women and Children, the Hospital for Sick Children, the Ophthalmic Hospital, the Benn Ulster Eye, Ear and Throat Hospital, the Union Infirmary and Fever Hospital, the Fever Hospital, Purdysburn, the District Lunatic Asylum, the Samaritan Hospital, Forster Green Hospital for Diseases of the Chest, and the Belfast Hospital for Skin Diseases

Scholarships—(1) Twelve, of the value of £40 each, are assigned as Entrance Scholarships in the Faculties of Arts, Science and Medicine, tenable for one year, (2) sixteen Professional Scholarships, value from £15 to £40 each, (3) one Hutchinson Stewart Scholarship, £12, in mental diseases, (4) one Mackay Wilson Travelling Scholarship, £100, awarded triennially, (5) Isabella Tod Memorial Scholarship tenable for three years, awarded triennially to a woman student, (6) Magrath Clinical Scholarship, awarded annually, value about £112, (7) two Musgrave Studentships of £200 in Physiology and Pathology, (8) numerous sessional prizes There is also a post-graduate research fund, open to all graduates of not more than three years standing Gold medals are awarded at the M D examination

Fees—The cost of the curriculum intended for students proceeding to the degrees of the Queen's University of Belfast is approximately £150 This includes examination fees and a perpetual ticket for attendance at the Royal Victoria Hospital or the Mater Infirmorum Hospital and fees for the special hospitals If course for the Conjoint Board costs about the same amount

The Regulations of the Medical Faculty, containing full information, can be obtained on application to the Secretary, Queen's University, Belfast, price 4d

UNIVERSITY COLLEGE, CORK

THIS institution, formerly known as Queen's College, Cork, is one of the constituent colleges of the National University. It holds examinations for all the faculties of that university, in addition to continuing the work which it has hitherto performed—namely, that of providing education adapted to the needs of medical students at all stages of their career. Its first aim is to fit students for the degrees of the new university, but students proceeding for the examinations of the Conjoint Board of England, Scotland, or Ireland, the Society of Apothecaries of London, or the Apothecaries' Hall of Ireland, or London University, can arrange the courses of lectures which they attend, and the order in which they attend them, to meet the requirements of those bodies. Certificates of attendance at the college courses are also accepted by the University of Cambridge. Clinical instruction is given at the North and South Infirmaries (each 100 beds) and at the Cork Union Hospital (1,200 beds). Students can also attend the Mercy Hospital (60 beds), the County and City of Cork Lying-in Hospital, the Maternity, the Hospital for Diseases of Women and Children, the Fever Hospital, the Ophthalmic and Aural Hospital, and the Eglinton Lunatic Asylum. The session extends from October to June.

There is a Dental School in which the degree of Bachelor of Dental Surgery of the National University of Ireland can be obtained. There is a large well equipped dental hospital in connexion with the school.

Scholarships.—Over £1,000 is available annually for scholarships in the College. Particulars as to each of them can be obtained on application to the Registrar.

Fees.—The fees for the lectures and hospital attendances required by the National University of Ireland course including examination fees come to about £150.

Further information can be found in the college regulations or obtained on application to the Registrar.

UNIVERSITY COLLEGE, GALWAY

THIS institution is one of the constituent colleges of the National University of Ireland, and includes Faculties of Art, Science, Law, Celtic, Engineering, Commerce, and Medicine. The college buildings are well lighted and well ventilated and contain dissecting rooms, an anatomical theatre, and laboratories for the study of physiology, chemistry, physics, and other departments of medical science. For pathology and chemistry new laboratories are now provided. It has good grounds surrounding it and there are many arrangements, such as a library, a college union, and an athletic union, for the benefit of those belonging to the Medical Faculty, as well as for students in other departments of the college. The clinical teaching, which is recognized as qualifying not only for the degrees of the National University, but for those of London University and the diplomas of the various colleges in the three kingdoms, is carried on at the Central Hospital, Galway County Hospital, the Galway Fever Hospital, and the Galway Dispensaries. The Galway Central and County Hospitals are general hospitals, and at the other two hospitals and at the dispensaries students have ample opportunities of studying zymotic and chronic diseases. The Central Hospital has a special ward for diseases of children. Each year the governing body offers about £1,500, and the County Councils of Connaught offer about £3,500, in scholarships. These scholarships are tenable in any faculty. Additional information regarding these scholarships can be obtained on application to the Registrar, and to the Secretaries of the Connaught County Councils.

CLINICAL HOSPITALS IN ENGLAND

MANY hospitals in Great Britain and Ireland, though not connected with any medical school, open their doors either to those who have yet to be qualified, to those who are doing post-graduation work, or to both. The facilities they offer for gaining practical clinical experience are very great, and should not be overlooked. Their honorary staffs commonly make a point of giving such instruction as opportunity offers, and at those situated in the larger towns there are often appointments as clinical assistants to be obtained. In addition, they all have to offer, at shorter or longer intervals, appointments for resident medical officers, house-physicians, and house-surgeons. These are usually paid offices, which may be held for periods varying from six months to a year. Some of those situated in the great medical centres in the provinces, and in Scotland and Ireland, have already been mentioned in speaking of the medical schools in those localities, but it should be added that there are many other provincial hospitals where admirable work is done, and at which much valuable experience can be gained by both senior and junior students, and by those already qualified. Cases in point are the Royal Infirmary, Bradford, the Royal Sussex County Hospital, Brighton, the Royal United Hospital, Bath, the Kent and Canterbury Hospital, the Derbyshire Royal Infirmary, the Royal Albert Hospital and Eye Infirmary, Devonport, the Royal Devon and Exeter Hospital, the West of England Eye Infirmary, Exeter, the Gloucestershire Royal Infirmary and Eye Institution, the Royal Infirmary, Leicester, the County Hospital, Lincoln, the General Hospital, Northampton, the Norfolk and Norwich Hospital, the General Hospital, Nottingham, the Royal Portsmouth Hospital, the Royal Berks Hospital, Reading, the Royal South Hants and Southampton Hospital, the Staffordshire General Infirmary, Stafford, the North Staffordshire Infirmary at Hartshill, the Royal Hants County Hospital, Winchester, the Wolverhampton and Staffordshire General Hospital, the County Hospital, York, and the Coventry and Warwickshire Hospital.

London Clinical Hospitals

As for the hospitals in the metropolis, so many of these take a share in the giving of clinical instruction that it is worth while to classify them.

General Hospitals.—These include the Dreadnought Hospital at Greenwich and its annexe at the Albert Dock, which form the headquarters of the London School of Clinical Medicine and the London School of Tropical Medicine with its hospital at Endsleigh Gardens; the West London Hospital and the Prince of Wales's General Hospital, Tottenham, both of these being described in the article on post-graduate work; the Royal Northern Hospital, Holloway Road, an institution containing 185 beds; and the Temperance Hospital in Hampstead Road.

Children's Hospitals.—There are at least seven of these, the leader among them being the Hospital for Sick Children, Great Ormond Street, which has 240 beds. There are also the East London Hospital for Children, Shadwell, with 124 cots; the Queen Elizabeth Hospital for Children, Bethnal Green, with 134; the Victoria Hospital for Children, Chelsea, with 104; the Belgrave Hospital for Children, which has a considerable out-patient department but in-patient accommodation for only 40 children; the Paddington Green Children's Hospital, an institution of about the same size; and the Evelina Hospital for Sick Children, Southwark, Brid Road, with 76 beds. The largest and the oldest of the hospitals for both women and children is the Royal Waterloo Hospital for Children and Women, Waterloo Road, S.E.1.

Hospitals for Women.—Queen Charlotte's Maternity Hospital, Marylebone Road, with 70 beds and a residential college for students and practitioners specializing in the teaching of midwifery; The Samaritan Hospital for Women, Marylebone Road, admits qualified practitioners as clinical assistants to both the in-patient and out-patient departments; demonstrations are given daily in both departments; the fees—payable in advance—being £3 3s. for three months; full particulars may be obtained from the secretary. In addition may be mentioned the Hospital for Women, Soho Square, whose teaching is confined to post-graduates in limited numbers; the Chelsea Hospital for Women, Arthur Street, Chelsea; and the Elizabeth Garrett Anderson Hospital for Women, in Euston Road, the latter being in the nature of a general hospital so far as concerns the classes of case treated.

Eye Hospitals.—The largest of these is the Royal London Ophthalmic Hospital (Moorfields), City Road. At this hospital there are complete courses of instruction are given during the year—October to February, and March to July—comprising the following subjects: anatomy, physiology and optics; ophthalmic medicine and surgery—(1) external disease, (2) motor anomalies and squint, (3) ophthalmoscopic conditions (weekly classes), (4) pathology; practical refraction classes; methods of examination (practical); operative surgery; practical pathology; practical bacteriology; x-ray and radiotherapy; clinical lectures; discussion classes. A fee of 24 guineas entitles the holder to one full five months course (with the exception of practical pathology and practical bacteriology together with a permanent ticket for the practice of the hospital. Fee for the practice of the hospital (permanent) £5 5s.; for three or six months £3 3s.; for two months £2 2s.; for one month £1 1s. Gentlemen are eligible under certain conditions for the posts of chief clinical assistant, clinical assistant, and junior assistant. Clinical work takes place every morning at 9 o'clock and operations at 10. An additional special course in the preliminary subjects (namely, anatomy, physiology, and optics) for the D.O.M.S. and other examinations in ophthalmology will be held immediately preceding the date of the examination. There are

for this course will be 12 guineas, or £5 5s for any subject separately Further particulars may be obtained from the Dean of the Medical School Other eye hospitals are the Royal Westminster Ophthalmic Hospital near Charing Cross, the Royal Eye Hospital, Southwark, and the Central London Ophthalmic Hospital, Judd Street, W C 1, each with about 40 beds

Fever Hospitals—The Metropolitan Asylums Board has under its control a good many institutions in and around London for the treatment of the more serious zymotic disorders, it makes special arrangements for the instruction of students in this subject, and grants certificates at the end of the courses Detailed information should be sought from the Clerk to the Board, Victoria Embankment, E C 4

Chest Hospitals—The largest of these is the Brompton Hospital for Consumption, which has 333 beds and a large sanatorium at Frimley with 150 beds There is also the City of London Hospital for Diseases of the Chest, Victoria Park, with 175 beds, and the Royal Hospital for Diseases of the Chest, City Road, now amalgamated with the Royal Northern Hospital, Holloway Road

Nose, Throat, and Ear Hospitals—The institutions which confine their work to disorders of the throat, nose, and ear all make special arrangements for the benefit of senior and post graduate students They are the Metropolitan Ear, Nose, and Throat Hospital, Fitzroy Square, the Royal Ear Hospital Dean Street the Central London Throat, Nose, and Ear Hospital, Gray's Inn Road, and the Hospital for Diseases of the Throat, Golden Square—the last, which possesses 75 beds, being the largest of the four institutions

Miscellaneous Special Hospitals—Among these are the Bethlem Royal Hospital, St George's Fields, S E 1, which confines its work to the treatment of mental diseases, and includes a department for nervous and early mental disorders, St Peter's Hospital for Stone and Urinary Diseases, Henrietta Street, Covent Garden, St Mark's Hospital, City Road, which devotes itself to the treatment of diseases of the rectum, including cancer and fistula, the National Hospital for Diseases of the Heart in Westmoreland Street, W 1, St John's Hospital for Diseases of the Skin, in Leicester Square, the Hospital for Diseases of the Skin Stamford Street, Blackfriars, and the National Hospital for the Paralysed and Epileptic, Queen Square, W C 1, an institution possessing 200 beds and a world-wide reputation

Detailed information as to the teaching arrangements of all these institutions may be obtained on application to their secretaries

WOMEN IN MEDICINE

THE regulations of the General Medical Council and of the various universities and colleges set out in previous sections apply to women as to men

Examinations

Women are admitted to all the medical examinations of the following qualifying bodies the Royal College of Physicians, London, the Royal College of Surgeons of England, the Society of Apothecaries of London, the Conjoint Boards in Scotland and in Ireland, and all the Universities of Great Britain and Ireland

Medical Education

The London (Royal Free Hospital) School of Medicine for Women, which is one of the constituent schools of the Medical Faculty of the University of London, is the sole school for medical education which admits women only All the resident appointments at the Royal Free Hospital, of which there are nineteen yearly, are held by women Arrangements are made for students of the School to obtain clinical instruction at the Hospital for Sick Children, Great Ormond Street, the National Hospital for Nervous Diseases, the Royal London Ophthalmic Hospital (Moorfields), the Elizabeth Garrett Anderson Hospital, the South London Hospital for Women, and the Cancer Hospital Further particulars with regard to the London School of Medicine for Women will be found on page 423

Women are also admitted to the following men's schools in London University College Hospital (a limited number only), King's College Hospital, Charing Cross Hospital, the Westminster Hospital, and St Mary's Hospital Further particulars about these schools will be found in the article on London Medical Schools at page 418 et seq The medical schools of Birmingham, Bristol, Cardiff, Leeds, Liverpool, Manchester, Newcastle, and Sheffield admit women In Scotland, the medical schools of Aberdeen, St Andrews, Edinburgh, and Glasgow admit women, although they do not in every case accord them equal facilities with men The Irish Universities and Colleges are open to women

Openings for Medical Women

The London School of Medicine for Women celebrates its jubilee in October of this year During the fifty years of its existence over 1,000 women have graduated from this school At the present time most of them are engaged in active medical work During the war the number of fresh students increased very considerably, and this has resulted in keen competition for appointments in recent years During the last six months of 1923 sixty graduates of the School obtained appointments.

The Public Health Service, and especially its department of Maternity and Child Welfare, provides openings for women, but in this connexion heed should be paid to the notes of caution sounded in the paragraphs printed below. In addition nearly all the voluntary welfare centres in the country are officered by medical women The rapid growth in recent years of Maternity and Child Welfare Centres has given women, to whom such work is peculiarly suited, an opportunity of participating in this important branch of preventive medicine Under the Board of Education there are appointments for women as medical advisers and school medical inspectors The London County Council has medical women as lecturers and examiners on the care of children, home nursing, health, and first aid Many of the venereal disease clinics have at least one medical woman on the staff A certain number of appointments as tuberculosis officer are held by women An increasing number of women are engaged in private practice in England

Appointments are held by women as residents in general hospitals, hospitals for women and children, sanatoriums, infirmaries, fever hospitals, and asylums

Particulars of the Colonial appointments which may be held by women in British West Africa and the Malay States can be obtained from the Medical Branch of the Colonial Office In India, both in private practice and in the various mission services, there is a large field, especially in obstetrics and gynaecology Information regarding the women's medical service for India may be obtained from the Honorary Secretary, United Kingdom Branch of the Countess of Dufferin's Fund, c/o General J B Smith, India Office, Whitehall, S W 1

Equal Pay for Equal Work

The British Medical Association was the first of all professional organizations to lay down the principle that no distinction should be made on the ground of sex as regards the emoluments to women members of the profession Attempts are continually being made by public authorities to obtain the services of women doctors at lower salaries than those paid to men, and the Association looks to all medical women to help it in resisting such attacks upon the solidarity of the profession In its constant efforts to maintain this principle the Association works in close co-operation with the Medical Women's Federation (9, Clifford Street, New Bond Street, W) In defence of the principle the British Medical Association has at various times fought—usually with success—Government departments and local authorities of all kinds Where the authorities concerned have declined to recognize the justice of the claim that equal pay should be given for equal work the machinery, local and central, of the Association has been put into operation, and as a result the authority has generally seen fit to drop the proposed distinction between men and women practitioners or given up the attempt to fill the post It is hardly necessary to add that the British Medical Association can only be successful in carrying out this policy if it receives the loyal support of all medical women

Public Health Work

In regard to the openings for women in the various branches of the Public Health Service, briefly mentioned above, it may be well to draw attention to an editorial article which appeared in the February issue of *Public Health*, the journal of the Society of Medical Officers of Health, and to an article on public health work as a career by Dr Winnifred M Gray, published in the Medical Women's Federation *News-Letter* for July, 1924

The article in *Public Health* is a warning, couched in very plain terms, addressed to young women and their parents. We quote the last three paragraphs:

During the past two or three years we have received with increasing frequency numbers of letters from qualified medical women. All these letters show clear signs of disillusion following on the enthusiasm originally inspired by the brightly coloured pictures painted by the well-meaning enthusiasts whose ob-ject is to keep up to a maximum the number of women entrants into the medical schools. Many of the writers state plainly that they find it impossible to make a living in general practice, while others declare that the continual grind and petty annoyances of practice are unendurable for women and that they are on the verge of a breakdown in health.

All these writers who are in practice make a pathetic appeal for advice and help with regard to obtaining a public health appointment. It should be clearly understood however that public health represents an extremely limited field for women, and even among those who have obtained such appointments there is great discontent and disappointment. The majority of women who hold public health appointments have far less leisure, shorter holidays and more annoyances and worries than the average woman teacher who has in many instances only a slightly lower salary.

Attracted by the bright prospects held out to them there are large numbers of women every year entering the already overcrowded profession of medicine, and all parents and guardians who are considering possible careers for girls should be warned that there are at the present time many qualified women in actual poverty, and that the number of these is likely to be considerably increased in the near future.

Dr. Winnifred Gray's opinions are much more cautiously expressed. While agreeing that there are a considerable number of openings in all branches of the Public Health Service, she declares that the greatest mistake a recently qualified person can make is to go straight into a full-time public health appointment such as that of school medical inspection or maternity and child welfare work. She then discusses the qualifications and experience required for public health work, the opportunities and openings, and the remuneration which this work offers. The openings in public health work, she says, are many, but the outlets are few:

Medical practitioners are led to accept these posts and are attracted to them in the hope that they may lead to an appointment as a chief medical officer of health, but few ever reach that position even among men medical officers, although these posts are the stepping-stones to the higher offices. The opportunities for good individual research work vary. The work is there crying to be done, but one is often hampered as far as elementary school inspection is concerned by regulations as regards the number of children to be examined per day, bad or unsuitable accommodation, etc.

Dr. Gray then suggests certain questions which might well be investigated by women practitioners engaged in this branch of work, to show that there is a wide field practically unexplored and ample opportunity for observing the beginnings of disease. She continues:

The opportunities for good work are there, but that does not mean that there are many chances of promotion in the Public Health Service. There are very few senior posts, and the waiting list is long, so the prospects of promotion, especially for women, are not good, and in the evening clerical work or venereal diseases clinic work is often heavy.

Discussing remuneration, Dr. Gray points out that while the number of posts as assistant medical officers to local or educational authorities has increased greatly, the majority of these posts carry a salary of £600 per annum for full time work, with no prospects of increase; that with some authorities there is no superannuation scheme, and that there is no regular system of promotion:

Owing to the great increase during the past ten years or so in the number of women medical students there is keen competition for posts, and some women may feel disheartened and be glad to accept even the smaller paid posts. Rather than accept a post with poor prospects, poor (initial and final) salary, and machine-like ineffectual work, it is far better in every respect to go further afield and gain good general experience, and then come back and take up general practice. There would then be some interest in the work.

After insisting that it is the duty of all women who qualify to support the principle of equal pay for equal work at suitable scale standard, Dr. Gray sums up her conclusions as follows:

1. Nobody should take up Public Health work without good qualification and post-graduate experience, as in most cases it is a useful diagnostic occupation.

2. The £600 minimum salary for Public Health work will in many instances be a maximum, and due consideration should be given to the various pros and cons of personal settling in such work. Preventive medicine is a good field, but one should not enter it with one's eyes shut. I may therefore appear critical, but I am merely trying to show that it may often be difficult to alter one's course, and it is therefore best to be forearmed.

3. General practice will for some time afford better chances of advancement for women than Public Health.

4. Experience and good work are valuable in India, China, etc., and would relieve the unemployment among medical women in this country, and at the same time offer a true service to the women in these parts.

DEGREES FOR PRACTITIONERS

At one time it was almost the universal custom for medical students educated in London and aiming at general practice not to seek a university degree, and as that custom still prevails to a considerable extent a large proportion of medical men in England possess diplomas or licences to practise but not degrees in medicine. This is a fact which they sometimes find reason to regret, and to such practitioners the following paragraphs may be of interest. It should be noted however that the M.D. Brux. diploma, if obtained subsequently to June, 1926, is not registrable, and that the University of Brussels no longer holds special examinations for foreign medical practitioners.

University of London

Registered medical practitioners who have passed the First Examination for medical degrees and the Second Examination for medical degrees, Part I, may proceed to the Second Examination for medical degrees, Part II, and M.B., B.S. Examinations without observing the intervals prescribed by the regulations on producing certificates that they have gone through the required course of study at a school of the university, subject to the proviso that no degree of the university can in any circumstances be granted by examination to anyone in less than three years after passing the Matriculation Examination or after admission by the university or the candidate's right to exemption therefrom.

Persons over the age of 25 years who have *not entered* for the ordinary Matriculation Examination of the University but *hold certain definite professional* qualifications may be admitted to a special Matriculation Examination in four subjects, of which mathematics or logic must be *one*. This Professional Matriculation Examination is open to ministers of religion, barristers and solicitors, medical practitioners, registered teachers, also to engineers, architects, surveyors, pharmacists, accountants, auditors and associates of the Institute of Bankers, holding recognized qualifications conferred after examination. Information should be sought from the Registrar, The University of London, South Kensington, S.W.7.

University of Durham

The degree of M.D. is granted by the University of Durham to registered practitioners of not less than fifteen years' standing, who have been qualified and in practice for that period, upon the following conditions without residence. The candidate must be 40 years of age, and must produce a certificate of moral character from three registered medical practitioners. Should he not have passed an examination in Arts previously to the professional examination in virtue of which his name was placed on the *Register*, he is examined in classics and mathematics, if otherwise he is required to translate into English passages from any one of the following Latin authors: Cæsar, *De Bello Gallico* (first three books); Virgil, *Æneid* (first three books), or Celsus (first three books). Natives of India or the British colonies are placed on the same footing as natives of Great Britain. Natives of India must produce evidence from an Indian university that they have passed within one year an examination in Latin.

Professional Examination.—The candidate must pass an examination in the following subjects: (i) Principles and practice of medicine, including psychological medicine, hygiene and therapeutics, (ii) principles and practice of surgery, (iii) midwifery and diseases of women and children, (iv) pathology, medical and surgical, (v) anatomy,

medical and surgical, (vi) medical jurisprudence and toxicology. The examination is conducted by means of printed papers, clinically, and viva voce, at the College of Medicine, Northumberland Road, Newcastle, and in the Royal Victoria Infirmary. The classical part of the examination may be taken separately from the professional on payment of a portion (£10 10s.) of the full fee.

The examinations are held twice a year, towards the end of June and of December. Notice, accompanied by the fee and certificates, must be sent to Professor Howden, Registrar of the University of Durham College of Medicine, Newcastle-upon-Tyne, at least twenty-eight days before the commencement of the examination.

Fees.—The inclusive fee is 50 guineas, if a candidate fail to pass, 20 guineas are retained, but if he present himself again, 40 guineas only are required.

UNIVERSITY OF BRUSSELS

Until recently this university granted its M.D. to such foreign candidates as were already duly qualified in medicine and surgery in their own countries, provided they passed the three special examinations imposed. The examinations were conducted viva voce. The University of Brussels, however, announced three years ago that these special examinations would no longer be held, nor would the M.D. Brux. diploma be granted by the university to foreign medical practitioners as formerly. Nevertheless, we have been informed by the Secretary of the University, Dr. Jean Willems, that it is still possible for a foreigner to obtain in Brussels a diploma of "Docteur en medecine, chirurgie et accouchements," which, although it does not entitle to practise in Belgium, has exactly the same value as the Belgian legal diploma.

For Belgians (Dr. Willems writes) the usual length of studies is seven years: two years of candidature in sciences, two years of candidature of medicine, and three years of doctorate of medicine. But it rests with the Faculty concerned to decide on questions of equivalence of foreign academic records with the ordinary Belgian qualifications for admission to university courses, so that a student who has several years of university training in Great Britain may, on presentation of his certificates or diplomas, be admitted to follow the courses of the first, second, or even the third doctorate. I beg to insist on one point which, if properly understood, may spare your citizens much useless trouble. It happens that English practitioners, already bearers of an M.D. diploma, ask from the Faculty that our degree of doctor be conferred on them *ad eundem on payment of necessary fees*. The regulations of our University absolutely forbid that a diploma be granted to anybody, without at least one year's attendance on the courses.

POST-GRADUATION STUDY

THE POSITION IN LONDON

It is unfortunate that so far very little success has attended efforts made to establish in London a great centre of post-graduate education. There is no lack of material for post-graduation study, and teachers are plentiful. But of real organization capable of affording facilities such as exist even in post-war Vienna there is very little evidence. In any such organization two objects must be held in view: first, provision for study which will attract men of capacity from the Dominions, America, and foreign countries; secondly, courses which will benefit practitioners in this country whether they intend to perfect themselves in special forms of treatment or to bring up to date their knowledge of general subjects in medicine and surgery.

A committee under the chairmanship of the Earl of Athlone, appointed by Dr. Christopher Addison when Minister of Health, did something to crystallize ideas on the subject of post-graduate education. This committee recommended that a school attached to a hospital centrally situated in London should be devoted solely to post-graduate medical education, that it should be a school of the University of London, and that it should receive financial assistance from Parliament. These recommendations have not been carried out.

Many have held that a hospital entirely devoted to post-graduate students need not for the moment be regarded as essential to a *post-graduate* scheme for London, but that a central co-ordinating body for post-graduate students might, with the material already available, lay the foundation of a scheme of which a post-graduate hospital might ultimately come to be the centre.

The Fellowship of Medicine was established in London in 1918 for the purpose of drawing together the members of all the inter-allied countries for the exchange of medical knowledge and the advancement of medical science. In May, 1919, a Post-Graduate Medical Association was founded. It owed its existence largely to the efforts of Dr. A. F. Hurst, physician to Guy's Hospital, and the majority of the London undergraduate medical schools promised their co-operation. Its president was the late Sir William Osler, who, at the inaugural meeting, said that the important thing was to pool interests and get the teachers everywhere to realize the importance of post-graduate instruction, energy, patience, and organization would do the rest. The two bodies were amalgamated in October, 1919. The combined body, which has been generously provided with an office by the Royal Society of Medicine (1, Wimpole Street), gives information regarding post-graduate facilities and organized courses of instruction at various hospitals scattered throughout London. After a time, however, the undergraduate hospitals withdrew from the organization, and the combined Fellowship of Medicine and Post-Graduate Medical Association has been reconstituted as representative of a number of hospitals not engaged in undergraduate teaching. A monthly *Bulletin* is issued containing a list of those hospitals which welcome the attendance of graduates. The facilities afforded are undoubtedly of great value in meeting the needs of visitors to London, whether from England, the Dominions and Colonies, or from foreign countries, but many consider that London is not yet in a position to take its proper place as a leading centre of post-graduate education.

For those who desire to revise or increase such medical knowledge as is useful in their professional work, the West London Post-Graduate College and the North-East London Post-Graduate College are eminently suitable. Some of the large undergraduate teaching hospitals provide short post-graduate courses, which are usually quickly filled up by old students; courses in special diseases can be obtained at a large number of special hospitals, a list of which is printed in the *Handbook for Recently Qualified Medical Practitioners*, issued by the British Medical Association.[1] Many of these hospitals are of world-wide renown, and are attended by post-graduate students from all parts of the world. Special note may perhaps be made first of the London School of Tropical Medicine, which has now been incorporated in the new London School of Hygiene and Tropical Medicine, of which Dr. Andrew Balfour has been appointed Director (see pages 395 and 437) and secondly, of the Maudsley Hospital, Denmark Hill, S.E. 5, and Bethlem Royal Hospital (p. 439), at both of which courses in psychological medicine are given preparatory to the examinations for the diplomas in that subject.

FELLOWSHIP OF MEDICINE AND POST-GRADUATE MEDICAL ASSOCIATION

The Fellowship of Medicine has arranged regular courses in general medicine and surgery, including special departments, each lasting two weeks, they are held once a month, and the fee for each course is 3 guineas (2 guineas for one week). Courses in ophthalmology, diseases of children, proctology, diseases of the heart, diseases of the nervous system, and gynæcology are given from time to time at the special hospitals in association with the Fellowship of Medicine. The monthly *Bulletin* contains a diary of the arrangements available for post-graduates in hospitals in London, and announces special courses of clinical lectures arranged for post-graduates. The programme for the immediate future includes a two weeks' course in general medicine and surgery, from September 22nd to October 4th, at the Westminster Hospital and associated special hospitals. There will also be special courses in infants' diseases at the Infants Hospital from September 15th to 27th, in ophthalmology at the Royal Westminster Ophthalmic Hospital (Charing Cross) from September 8th to 27th, and a course in psychological medicine at the Bethlem Royal Hospital from September 30th to October 25th. The offices of the Fellowship are,

[1] *Handbook for Recently Qualified Medical Practitioners.* 1923. British Medical Association, 429 Strand, W.C.2. 2s. 6d. net.

by favour of the Royal Society of Medicine, at No 1, Wimpole Street, W 1 (telephone, Mayfair 2263) The secretary is in attendance daily from 10 a m to 5 p m, excepting Saturday The annual subscription for membership of the Fellowship of Medicine and Post Graduate Medical Association has been fixed at a minimum of 10s

Provincial Universities

In the Provinces post-graduate courses have been organized in connexion with the universities at Birmingham, Bristol, Edinburgh, Manchester, and Oxford, and through the Post Graduate Medical Association at Glasgow Special courses also exist at Newcastle-upon-Tyne (University of Durham), Leeds and elsewhere Liverpool has its School of Tropical Medicine There is a course at Addenbrooke's Hospital, Cambridge, during the Long Vacation

It is a matter for satisfaction that the interest in post-graduate medical education is becoming more widespread, and in the development of this interest it is not impossible that the British Medical Association may take a part under the enlargement of the scope of its activities which its new buildings in Bloomsbury will render possible

Newcastle-upon-Tyne

For the year 1924-25 the following post-graduate courses have been arranged by the College of Medicine, Newcastle-upon-Tyne (University of Durham)

1 General courses in clinical medicine surgery and pathology at the Royal Victoria Infirmary meeting once weekly for ten weeks One course will be held from October to December and one from April to June

2 *Special courses of clinical instruction meeting once weekly* for ten weeks in the following subjects Gynaecology diseases of the eye diseases of the throat nose and ear diseases of the skin venereal diseases neurology

Special courses in midwifery will be held at the Princess Mary Maternity Hospital

3 An intensive course of fourteen days *duration* in the early part of the Summer Vacation, 1925

4 In addition to the regular post graduate courses practitioners may attend the ordinary medical and surgical practice of the Royal Victoria Infirmary *for specified periods*

Courses for Medical Graduates at Bristol

The University of Bristol provides courses of post-graduate study for practitioners Details of set courses at the Royal Infirmary and General Hospital are announced locally In addition, practitioners may become clinical assistants in medicine, surgery, or special subjects for periods of a month or more

The university also holds courses or demonstrations in outlying centres in the West of England Resident practitioners form themselves into a committee and consider *the type and extent of demonstrations required* The university furnishes the lecturers and makes all the necessary arrangements All inquiries should be addressed to the Director of Post-Graduate Studies, Pathological Department Bristol University

Daily Post-Graduate Study.—For those who are able to devote several hours each day to hospital practice the university offers special facilities for post-graduate work Qualified medical practitioners may be appointed as clinical assistants for a period of one or more months They may act as assistants, at times permit, in more than one department and in any of the hospitals during their period of study They will be entitled to the use of the clinical laboratories and medical library and have the right to attend in all departments, including operations, post-graduate and ordinary clinical demonstrations, and *post-mortem* examinations Fee, £3 3s a month

Post Graduate Clinical Work.—Demonstration courses with weekly lectures are held during May, June, and July Fee, £2 2s All inquiries and applications for admission should be addressed to the Director of Post-Graduate Studies (Clinical Section), Pathological Department, University of Bristol who can be seen on any day by appointment at the Pathological Department

Further information as to scholarships, curricula, and fees can be obtained from the Dean of the Faculty of Medicine, or the Registrar of the University, Bristol

Edinburgh Post Graduate Courses

In connexion with the University and Royal Colleges post-graduate courses are arranged every year from about the middle of July to about the middle of September, comprising (*a*) This year a Course in Obstetrics and Gynaecology was held from July 14th to August 8th (*b*) a Course on Diseases of Children from July 14th to 25th, (*c*) a General Medical Course (*d*) a General Surgical Course Courses (*c*) and (*d*) extended for four weeks from August 11th to September 6th Similar courses are held each year

The Course in Obstetrics and Gynaecology comprises instruction in Clinical Midwifery and Clinical Gynaecology, Obstetrics and Gynaecological Pathology, Child Welfare and Ante-natal Clinics, etc

The Course on Diseases of Children includes Medical and Surgical Clinics and Special Clinics on Diseases of the Skin, Venereal Diseases, Child Welfare, Mental Defect, Ear and Throat, Dental Clinics, and Ante-natal Clinics The General Medical Course includes lecture demonstration and where possible, practical instruction on Medical Anatomy, Medical Side-room Work, Examination of the Blood, X-Ray and Electrical Therapy, Morbid Anatomy, and *Post Mortems*, Clinical Instruction in Medicine, Diseases of Children, Diseases of the Skin, and Infectious Diseases, and Special Instruction in the Diseases and Methods of Examination of the Nervous, Circulatory, Respiratory, Alimentary and Renal Systems, and in Diseases of the Ductless Glands The General Surgical Course includes lecture demonstrations on Surgical Anatomy, Surgical Pathology, and Surgical X-Ray Diagnosis, Clinical Instruction in Surgery at the Royal Infirmary and Royal Hospital for Sick Children, Clinical Instruction in Venereal Diseases, Surgical Out-patients, Surgical and Gynaecological Operations and Special Instruction in Abdominal and Genito-Urinary and other branches of Surgery

A series of special lectures, open to all graduates, is delivered thrice weekly, on subjects of general medical and surgical interest, including recent advances in treatment Among the special courses also arranged are Examination of the Blood, Vaccine Therapy, Clinical Chemistry, Diseases of the Ear, Nose and Throat, and Venereal Diseases

Particulars regarding the courses, dates of commencing, fees, etc, may be had on application to the Honorary Secretary, Post-Graduate Courses in Medicine, University New Buildings, Edinburgh

Graduate Medical Teaching in Glasgow

Organized post-graduate medical teaching is available in Glasgow under the auspices of the Post-Graduate Medical Association This association is composed of practically all the teaching institutions in Glasgow and the various teachers giving post-graduate instruction, and its business is managed by a board elected periodically by them The chairman of the board is Principal Sir Donald MacAlister, Bt, and the vice-chairman Sir Hector C Cameron During the winter months special courses in various subjects are conducted, and there is a series of weekly demonstrations specially designed for local practitioners A comprehensive scheme of Clinical Courses is carried out during the summer months, from May till October, and arrangements have also been made whereby a limited number of graduates may become attached to wards or out-patient departments nominally as clinical assistants for definite periods throughout the year As such they work under the direct supervision of the physician or surgeon in charge, and carry out such detailed investigations as directed Those desiring further information should apply to Dr James Carslaw, Secretary, Post-Graduate Medical Association, 6, Woodside Crescent, Glasgow, C 3

West London Post-Graduate College

The work of this institution is carried on at the West London Hospital, the first in London to devote its clinical material solely to the instruction of qualified medical men The college started in 1895 it is provided with lecture, reading, writing, and class rooms, and accommodation of all sorts for the convenience of post-graduate students In the five years before the war the yearly entry averaged over 220 The work of the college is eminently suitable for men who wish to revive their general clinical knowledge after war work

As for ward work, the students accompany the senior staff on their visits to the wards at 2 30 p m daily, and also go round with the resident medical officers in the morning Out patient work begins at 2 p m This department is large, and affords ample facilities for post-graduates to see and examine patients There are the usual special departments Post-graduates are appointed to act as clinical assistants for three or six months, no charge being made Special practical classes are held in medicine, general practical surgery, gastro-intestinal surgery, medical and surgical diseases of children, analysis of blood and urine, cystoscopy, venereal disease, tropical diseases, retinoscopy, ophthalmic operative surgery, and, when material is available, in operative surgery The size of the classes is limited A special clinic for the treatment of venereal diseases (male and female) is held every evening (Saturdays included) at 5 30 Graduates are admitted to the work of the clinic free, and certificates of satisfactory attendance and work are given

Operations take place at 2 p m daily, the surgeons often availing themselves of the assistance of the post-graduates, and in any case making arrangements so that they can readily see what is going on The anaesthetists give instruction in the administration of anaesthetics, including spinal analgesia, on the operating days, students being allowed to administer them under supervision, while special classes are held in each session The pathological laboratory is in charge of a pathologist who attends every day

Demonstrations are ordinarily given in the morning by the assistant physicians and surgeons, and by the medical and surgical registrars

Fees—Hospital practice, including all ordinary demonstrations and lectures, £1 11s 6d for one week, £4 4s for one month, £7 7s for two months, £9 9s for three months £15 15s for six months, £23 12s 6d for one year, and £45 for a life ticket Instruction in the administration of anaesthetics is given at the rate of £3 3s a month

The certificates of the school are recognized by the Admiralty, the War Office, the Colonial Office, the India Office, and the University of London (for higher degrees) A prospectus can be obtained on application to the Dean

NORTH-EAST LONDON POST-GRADUATE COLLEGE

The headquarters of this post graduate school are situated at the Prince of Wales's General Hospital, in the midst of a densely populated North London district It contains 185 beds, and is within a few minutes' walk of South Tottenham station, on the London, Midland, and Scottish Railway, and Seven Sisters and Tottenham Hale stations, on the London and North-Eastern Railway It is readily accessible by electric tram from Finsbury Park and Hackney, and from Dalston, Edmonton, and other parts of North London

The college is recognized by the Admiralty and the India Office for the purposes of study leave, and by the University of London as a place for advanced study for the M D and M S degrees, the course of practical teaching of bacteriology is approved by the University of Cambridge for its D P H diploma, and there are ample arrangements for the convenience of men who are thus working or who, being in active practice, are desirous of getting themselves into touch with modern methods The hospital as a whole affords excellent facilities to qualified medical practitioners who wish to take part for a time in the work of an active general hospital, or to obtain special instruction in the several branches of medicine and surgery, since it is open to them to study diseases of the eye ear, throat, nose, skin, fevers, children's diseases, psychological medicine, dental surgery, radiography, the application of electricity in disease, and the administration of anaesthetics Throughout the sessions into which the year's work is divided, clinics lectures, and demonstrations are given by members of the teaching staff Operations are performed every afternoon of the week except Saturday Special intensive courses are held at intervals throughout the year, each lasting two weeks, clinical instruction being arranged for each hour of each day

Fees—Two guineas for a three months course of study in any one department which may be begun at any time A fee of 5 guineas admits to the whole practice of the hospital for a similar term (one month, 2 guineas, and one year, 10 guineas), and a perpetual ticket for the practice of the hospital may be obtained for 15 guineas

The winter session will be opened on October 21st, at 4 30 p m, with a cinematograph demonstration on the diagnosis and treatment of gonorrhoea in the male, to which members of the profession are invited

Additional information can be obtained from the Dean of the Post-Graduate College, at the hospital, or at 19a, Cavendish Square, London, W 1

AUSTRALIAN AND NEW ZEALAND MEDICAL ASSOCIATION

The Australian and New Zealand Medical Association gives information and advice to medical visitors from the Commonwealth and Dominions with regard especially to attendance at special clinics, post-graduate work, and facilities for preparing for examinations such as the M R C P, F R C S (England and Edinburgh), and the D P H, and also as to house appointments and clinical assistantships in London and the Provinces Information will also be given as to lodgings, sports, and social opportunities All medical graduates or undergraduates born in Australia or New Zealand and resident or visiting England are eligible to become members The fee is one payment of 5s Further information can be obtained from the joint honorary secretaries, Mr E T C Milligan, F R C S, and Mr Bedford Russell, F R C S, 86, Harley Street, London, W 1

TROPICAL MEDICINE

THERE are large and important schools of Tropical Medicine in London and Liverpool, and several universities and other examining bodies have instituted diplomas or degrees in the subject The Colonial Office now expects all nominees for the Colonial Medical Service to pass through one or other of the two schools mentioned before their appointments are confirmed, and commercial firms engaged in tropical enterprise commonly demand from medical applicants for employment corresponding evidence of special knowledge Information with regard to these schools and diplomas and degrees follows

DIPLOMAS AND DEGREES

LONDON UNIVERSITY—Tropical medicine is one of the six branches in which the M D degree may be obtained The regulations relating to the curriculum and examination correspond to those applying to the other branches

LONDON CONJOINT BOARD—This body grants a diploma in tropical medicine to candidates after an examination usually held in the months of April, July, and December Candidates must present evidence of having attended, subsequently to obtaining a registrable qualification in medicine, surgery, and midwifery, (1) practical instruction in pathology, protozoology, helminthology, entomology, bacteriology, and hygiene in relation to tropical medicine, in an institution recognized for this purpose, during not less than three months, (2) the clinical practice of a hospital recognized for the study of tropical diseases during not less than three months These conditions may be modified in the case of candidates who have had practical experience in tropical countries The fee for admission to the examination is £9 9s The Board also grants diplomas in psychological medicine, in ophthalmic medicine and surgery, and in laryngology and otology Candidates must hold a medical qualification registrable in the United Kingdom or be graduates in medicine of an Indian, Colonial, or foreign university Particulars and conditions of admission to these examinations, fees, etc, may be obtained from the Secretary of the Examining Board, Examination Hall, Queen Square, Bloomsbury, London, W C 1

UNIVERSITY OF LIVERPOOL — A diploma in tropical medicine is given by this university to students who have been through the courses provided by the Liverpool School of Tropical Medicine and have passed the examination held twice yearly by the university examiners The subjects of examination are (*a*) tropical pathology, parasitology, and entomology; (*b*) tropical and applied bacteriology, (*c*) tropical hygiene

and sanitation, (d) tropical medicine, including etiology, symptoms, diagnosis, and treatment of tropical diseases Further information can be obtained from the Dean of the Faculty of Medicine, University of Liverpool

UNIVERSITY OF CAMBRIDGE.—This university grants a diploma in tropical medicine and hygiene to any person whose name has been on the *Medical Register* for not less than a year provided that he passes the examination of the university in this subject Previous to admission to the examination he must produce approved evidence that he has studied pathology (including parasitology and bacteriology in relation to tropical diseases), clinical medicine, and surgery at a hospital for tropical diseases, and hygiene and methods of sanitation applicable to tropical climates Examinations are held in January and August each year and last four days The fee for the examination and diploma is 9 guineas on admission or readmission Application for further information should be made to Dr G S Graham-Smith, Pathological Laboratory, Cambridge

SCHOOLS

LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE

The London School of Tropical Medicine, formerly under the auspices of the Seamen's Hospital Society, has, from August 1st, 1924, been incorporated by Royal Charter in the London School of Hygiene and Tropical Medicine, and the work of the School will continue as the division of Tropical Medicine and Hygiene of the new institution By the generosity of the Rockefeller Foundation a large sum has been provided for new buildings in Bloomsbury, but for the present the work of the School will be continued as heretofore in the Seamen's Hospital Society's buildings at the Hospital for Tropical Diseases, Endsleigh Gardens, N W 1, where the specially equipped laboratories, museum, library, and clinical facilities afford excellent opportunities to the student and others who may be desirous of studying diseases incidental to tropical climates before entering the services or going abroad In the wards of the Hospital for Tropical Diseases are to be found cases such as may be met with in actual practice in the tropics There are three courses in the year, lasting three months, beginning September 25th, January 9th, and April 24th approximately The course is so arranged as to equip men for the Cambridge D T M and H and the D T M and H of the Conjoint Board Tropical medicine has been admitted as a sixth alternative subject for the M D of the University of London, and the school curriculum is adapted to afford facilities for candidates desirous of taking the M D in this subject Further information may be obtained from the Secretary, London School of Hygiene and Tropical Medicine, 23, Endsleigh Gardens, London, N W 1

LIVERPOOL SCHOOL OF TROPICAL MEDICINE

This school is affiliated with the University of Liverpool and the Royal Infirmary of Liverpool Two full courses of instruction are given every year, commencing about January 6th and September 15th lasting for the term of about thirteen weeks, and followed by the examination for the diploma in tropical medicine given by the University of Liverpool Two courses in veterinary parasitology are also given, commencing about the same dates as the diploma courses In addition to the full courses, an advanced course of practical instruction in tropical pathology and medical entomology lasting a month is given every year in June It is of such a kind as to be very useful to medical men returning from the tropics on short leave A special course of instruction in entomology etc is also given three times a year to officers of the East and West African Colonial Services Students of the school who do not care to undertake the examination held by the university at the end of each term for the diploma in tropical medicine are given a certificate if attendance has been satisfactory

Fees.—The fee for the full course of instruction is 20 guineas with an extra charge of 1 guinea for the use of a microscope if required The fee for the Diploma Examination is 5 guineas for the advanced course 6 guineas and for the course in veterinary parasitology 15 guineas

The new laboratories of the school adjoin the university and the tropical ward of the Royal Infirmary The dimensions of the building are 162 ft in maximum length by 84 ft in width In addition to the basement, in which are accommodated the photographic department and large storage rooms, there are four floors The ground floor has (1) lecture theatre, with accommodation for about seventy students, (2) library (3) a spacious museum, with preparation room adjoining The first floor has twelve rooms, in which are housed the Departments of Tropical Medicine and Entomology The second floor has the main class laboratory, 69 ft by 58 ft, excellently lighted and three other rooms, devoted to the Department of Parasitology The third floor has a large research laboratory and two research rooms On the roof is an insectarium, a mosquito-proof house, and other accommodation

Since it was instituted the school has dispatched to the tropics thirty-two scientific expeditions many of the workers having been taken from among its students The work done by them has been published in twenty-one special memoirs, besides textbooks and numerous articles in the scientific press also in the *Annal of Tropical Medicine and Parasitology* of the school In connexion with the school are (1) the Manaos Research Laboratory in Brazil, and (2) the Sir Alfred Lewis Jones Tropical Laboratory, Sierra Leone, which was opened on January 10th, 1922 Further information may be obtained from the Honorary Dean, School of Tropical Medicine, Pembroke Place, Liverpool

PSYCHOLOGICAL MEDICINE

IT cannot be impressed too strongly upon the medical student that a knowledge of mental disorder is just as essential as a knowledge of the other forms of disease which he will be called upon to treat in the routine of general practice *It must be understood* that by the term mental disorder is not only meant those severe forms which are to be found in asylums, but the term also includes mental defectives of all grades, nervous, difficult, and backward children, the mild and often unrecognized psychoses, and also the various types of psychoneurosis Such disorders provide the general practitioner with a large proportion of his most difficult cases, and he will find a good knowledge of mental disorder invaluable in his work Apart from general practice, the student who proposes to take up a career in the prison service or, still more importantly the school medical service, will find a knowledge of psychological medicine an almost essential part of his equipment

Instruction

At the present time the instruction given to the student is far from adequate to supply the knowledge of mental disorder requisite for the needs of the general practitioner The facilities for the study of psychological medicine in the general hospitals are now much greater than in former years Thus many of the teaching hospitals have out-patient departments for the treatment of mental cases, and in some of these hospitals special lectures are given on psychopathology These facilities need not be utilized by the student, however and the compulsory part of the curriculum is confined to formal lectures and a few attendances at some mental hospital Here the student is apt to see mainly the terminal states of mental disease, and he is also apt to gain the impression that mental disorder is necessarily related to segregation and custody We would therefore impress upon him the importance of attending the out-patient department for mental disorders where he will be able to observe the mild and early cases such as he will hereafter meet with in general practice

The Ministry of Health issued last year a memorandum by Sir George Newman on *Recent Advances in Medical Education in England*[1] The inadequacy of the facilities for the teaching of psychopathology is here commented upon, and it is pointed out that the general practitioner must be competent to diagnose all the chief forms of mental disease and defect (Lunacy Act, 1890, Mental Deficiency Act, 1913 Elementary Education (Defective and Epileptic Children) Acts, 1899 and 1914) The certificates under these Acts are shown to necessitate a diagnosis, a record of the clinical grounds for it, and in some cases the medical

[1] H M Stationery Office, 1923 To be purchased through any bookseller 1s. 3d. net

reasons for detention or custodial care. It is evident, as Sir George Newman points out, that these requirements are sufficiently exacting to render necessary the proper education in this subject of every medical student, and it should be practical and the subject of examination. The curriculum in mental diseases suggested is as follows:

"(i) A short course of lectures in normal psychology, preferably as part of the course in physiology (reflexes, habit, instinct, emotion, intelligence, the conscious and the unconscious mind, Binet tests, investigational methods, etc.)

"(ii) Half a dozen explanatory discourses in abnormal psychology, to be taken concurrently with clinical work in mental disease.

"(iii) Ten or twelve systematic lectures on mental disease, concurrently with clinical work, and clinical demonstration, at a mental hospital, of in-patients, pronounced cases (recent or chronic), and the usual types of insanity.

"(iv) A series of demonstrations in the out-patient clinic for nervous and mental disorders at the general hospital.

"What the student needs is instruction in the etiology, symptoms, diagnosis, treatment, and prognosis of the morbid mental states most commonly [illegible]. The student must also be trained in [illegible] of patients, dealing with relatives of [illegible] ions, etc."

A scheme is now in actual operation at the Middlesex Hospital in which a small number of mental cases are treated in the hospital as in-patients. This is an important move from the teaching point of view, because the student will gain true insight into the relation between mental disorder and medicine as a whole, and he will realize that it is a form of illness to be studied with other diseases and to be treated along similar lines.

In London post-graduate courses of instruction of a comprehensive kind are given at the Maudsley Hospital and at Bethlem Hospital, and at the National Hospital for the Paralysed and Epileptic, Queen Square, courses are arranged to meet the requirements for the diploma in psychological medicine in regard to nervous diseases. Courses in mental deficiency are arranged by the University of London. There are also post-graduate courses at the Universities of Edinburgh, Glasgow, Cambridge, Birmingham, Leeds, Manchester, Durham, and elsewhere.

Diplomas

Those who are taking up psychiatry as a career will find it desirable to obtain a diploma in psychological medicine. Such a diploma is not at present compulsory for a permanent position on the staff of all mental hospitals, but it will probably become so in course of time, just as it is now essential to obtain the D.P.H., if a career in public health is contemplated. Psychiatry is one of the branches of medicine which candidates for the M.D. degree of the Universities of London and Edinburgh can take up, and, in addition, diplomas in psychological medicine, to which reference has been made, can be obtained from the Universities of Cambridge, London, Edinburgh, Durham, Leeds, Manchester, and the National University of Ireland, and from the Conjoint Board in England. The Medico-Psychological Association of Great Britain and Ireland also grants certificates of proficiency after examination, and encourages the study of psychiatry by the offer of prizes for original and research work.

The requirements for a diploma differ to some extent in the various universities and colleges, but the following model scheme suggested by the Medico-Psychological Association, and already adopted by the Royal College of Physicians of Ireland, will give an indication of the scope of the examination for a diploma.

Model Scheme for a Diploma in Psychological Medicine

1. The candidate must be already a registered medical practitioner.

2. The candidate may present himself for examination on the subjects detailed under Part I of the curriculum (see para. 4) immediately he has concluded the prescribed courses of instruction, or can produce such other evidence of diligent study of the subjects to be examined upon as may be demanded. Part I must be passed save by special permission at least three months prior to entering for examination on Part II of the curriculum.

3. The candidate may not present himself for examination on the subjects detailed under Part II of the curriculum (see 4) until he has been a registered medical practitioner for not less than two years. He must subsequently to qualification, have been in the practice of an approved mental hospital for not less than two years or have attended for six months at a hospital, mental or general, for clinical instruction in psychological medicine and subsequently held a resident appointment at an approved mental institution or mental wards of a general hospital for not less than six months. In both cases he must produce a certificate from a recognized source that he can apply his theoretical knowledge, and has practical acquaintance with and is well and adequately versed in, the current clinical methods of examination and treatment of nervous and mental disorders. In the case of mental deficiency the certificate should include a practical knowledge of the various intelligence tests and other methods of ascertaining the degree of mental defect. He must also produce evidence of having attended, subsequently to qualification, courses of lectures, demonstrations, or other evidence of diligent study of the subjects upon which he presents himself for Part II of the examination, as may be demanded.

4. Curriculum. Part I.—(*a*) Anatomy, histology and physiology of the nervous system, including the autonomic system, anatomy and physiology of the endocrine glands, chemistry and cytology of the cerebro-spinal fluid. (*b*) Psychology, systematic and experimental. Part II.—(*a*) Morbid anatomy, histology and pathology of the systems mentioned under Part I, (*a*) post mortem and laboratory technique, (*b*) neurology and clinical neurology, (*c*) psychiatry (including the psycho-neuroses), clinical psychiatry and the medico-legal relationships of mental disorders and mental deficiency. In addition the candidate for Part II will need to show special knowledge of any one subject, to be selected by him from the subjects comprising Part I or Part II, or may choose to be examined in any one of the following subjects. (*d*) Mental deficiency and the mental disorders of childhood and adolescence, and the duties of school medical officers in relation thereto. (*e*) Bacteriology as applied to mental and nervous disease. (*f*) Psycho-pathology and psycho-therapy. (*g*) The principles of diet, vitamins, and basal metabolism, and their application. (*h*) Eugenics and vital statistics. (*i*) Criminology and the jurisprudence of criminal responsibility.

5. The diploma, by request, may be endorsed that special knowledge has been shown in the subject selected.

6. It is suggested that any compulsory attendance at lectures or demonstrations and clinical courses should be limited to the subjects detailed for Part II and that the course for Part I or Part II should not exceed eight weeks.

Mental Hospital Appointments

Those who take up psychiatry as a career work as medical officers of public or private mental hospitals or similar institutions. Except in the larger institutions, such as those under the control of the London County Council, where a number of the medical officers are allowed to live out if married, the medical staff are resident officers, having board, lodging, etc., either in the hospital itself or a residence in the grounds. Junior assistant medical officers receive about £300 to £400 per annum, and senior assistant medical officers about £500 to £700, in both cases with board, lodging, laundry, etc., in addition, if married, the board, etc., is commuted for cash. As the mental hospitals are under local control the salaries vary much in different asylums. Medical superintendents, whose pay commonly ranges between £800 and £1,500 per annum, are provided with a house in the grounds of the hospital and draw various allowances.

Since the passing of the Asylum Officers' Superannuation Act of 1909, all officers and others of the established staff of a public (county or borough asylum) mental hospital may retire at the age of 55 on a pension varying from one-half to two-thirds of the value of their pay and emoluments, or one-fiftieth for every year served, paying as contribution 3 per cent. of the value of their appointments annually. This very favourable prospect may not appeal to junior practitioners joining the services, but will eventually prove to be a valuable asset.

Prospects in the Public Service

Appointments to the public mental hospitals are made by the visiting committees, and in most cases only the junior posts are open to those who have not had previous experience in psychiatry. Since the public mental hospital service is a local and, except indirectly, not an imperial one, the promotion tends to be slow and uncertain, and the higher positions are not always advertised and thus thrown open to competition. For this and other reasons mental hospital work has undoubtedly not been in favour with newly qualified men in years past, but the general conditions of service have tended to show a progressive improvement and will in all probability continue to do so in the future.

In March, 1920, the Board of Control did useful service by issuing to visiting committees of asylums a circular upon the three following matters: (*a*) the dearth of suitable applicants when vacancies occur for the post of assistant medical officer, and the probable causes thereof; (*b*) the need of provision for the more effective treatment

upon modern lines of recoverable cases of mental disorder, (c) the necessity for raising the standard as to the training of existing and future assistant medical officers in asylum practice, and of affording facilities for such training.

Under (a) the Board of Control, after pointing out some of the disadvantages of the present state of affairs, made the following suggestions:

(i) That an improvement be made in the salaries of the assistant medical officers at least to such an extent that in the cases of all those who have been in the service above a certain number of years and are regarded as permanent officials the salary should be reasonably sufficient for a married medical man, and that in the case of the deputy superintendent it should more closely approximate than at present to that of the superintendent.

(ii) That in the case of a permanent official, application for permission to marry be not required that according to circumstances proper accommodation for a married man be provided and that subject to rules approved by the Secretary of State for the protection of the patients and with due regard to the proper administration of the institution permission to live out may be granted.

(iii) That to the title of assistant medical officer the words and deputy superintendent should be added to that of the one elected to be in charge during the absence of the medical superintendent.

(iv) That the use of the title senior assistant medical officer should not be restricted as at present to the post of first assistant but should be extended and be indicative of a certain standing and expert knowledge. By the adoption of this suggestion there would in many asylums be two senior assistant medical officers and perhaps even three or four in the larger asylums.

(v) That except where there has been previous asylum experience appointments to posts of assistant medical officers should in the first instance be temporary in character.

Under (b) the Board suggested that the treatment of recent recoverable cases should be carried out by members of the medical staff conversant with modern methods, and that the number of the medical staff should be sufficient to ensure that none of them is required to undertake the treatment of more than fifty recent cases at any one time. Under (c) suggestions were made with a view to encouraging assistant medical officers to obtain a diploma or degree in mental diseases, including provision for study leave on full salary. The attitude of the Board of Control is clearly shown in the following sentence:

> If the welfare, treatment and recovery of patients is not to be jeopardized and the study of mental diseases is not to lag behind the study of other branches of medicine the Board feel the necessity of initiating measures to maintain progress and to secure the best possible treatment of the patient.

Both the British Medical Association and the Medico-Psychological Association are working separately and together to improve present conditions of service and have for example already removed the "celibacy" objection to the service. The salaries have also been considerably increased, especially in the junior ranks and contrast favourably with those which were paid before the war. During the next few years considerable progress may be anticipated in the conditions under which the insane are treated. The asylums will tend to develop an atmosphere approximating more closely to that of the general hospitals. In these most desirable changes are brought about, the mental hospital service will become more attractive, and will afford greater opportunities for the medical graduate who proposes to specialize in psychiatry.

It may be said that while routine, administrative and clerical work bulk largely in mental hospital duties as they do in other public medical services, there is ample material, time, and scope for purely medical work and research—difficult as the subject may be—in psychiatry as one of the branches of medicine open to young graduates. A change in the Lunacy Law, in which power was given to local authorities to make provision for the treatment of early and acute cases of mental disorder without certification would do much to make psychiatric work more attractive to medical men. If this alteration in the law were made hospitals either in the precincts or the grounds of the county or borough mental hospitals or in adjacent towns would be erected in course of time or wards in general hospitals might be utilized for the same purpose. Such clinics would render appointments in mental hospitals more attractive because the work would be entirely free from the custodial aspects of mental disorder and attention could be given by the physician to purely medical problems without irksome legal restrictions.

MAUDSLEY HOSPITAL, DENMARK HILL

A number of courses of instruction for the Diploma in Psychological Medicine have been given at the Maudsley Hospital, the details of the last course being as follows. The course consisted of two parts, Part I being conducted by Sir Frederick Mott, Dr F. Golla, and Dr Henry Devine. Sir Frederick Mott gave eight lectures on the anatomy of the nervous system, followed by practical instruction and demonstrations on methods of staining nervous tissue and preparing it for microscopical examination, microscopic sections were distributed, illustrating the principal diseases of the nervous system for mounting as a permanent collection. Dr Golla gave eight lectures on the physiology of the nervous system, followed by practical instruction and demonstrations on physiological chemistry (including the chemistry of the nervous system, physico-chemical methods, blood and urine analysis and gastric contents analysis) and practical physiology (including the recording of reflexes and tremors in man and the action of drugs on the autonomic system). Similarly, Dr Devine gave eight lectures on psychology, followed by practical instruction and demonstration of psycho-physical methods and memory and intelligence tests. In Part II of the course Sir Frederick Mott gave six lectures on the pathology of mental diseases, including brain syphilis, its symptomatology and treatment. Dr Bernard Hart gave eight lectures on the psychoneuroses. Sir Frederick Mott and Dr F. Golla gave twelve clinical demonstrations in neurology, the first six demonstrations were given by Dr Golla at the Hospital for Paralysis and Epilepsy, Maida Vale. Dr F. C. Shrubsall gave eight lectures on the practical aspect of mental deficiency. Dr W. C. Sullivan, medical superintendent of Broadmoor Asylum, gave six lectures on crime and insanity. Dr C. Hubert Bond and Dr E. Mapother gave a course of lectures on the differential diagnosis and treatment of mental disorders and the legal relationships of insanity. The fee for the whole course (Part I and Part II) was 15 guineas or for each part separately 10 guineas for one single series of lectures in Part I the fee was 4 guineas and in Part II 2 guineas. Inquiries as to lectures, etc., should be addressed to the director of the pathological laboratory, Maudsley Hospital, Denmark Hill, S.E. 5.

BETHLEM ROYAL HOSPITAL

A course will be held at Bethlem Royal Hospital, commencing on September 15th of lectures and practical instruction for the Diploma in Psychological Medicine. It is proposed in future to give two courses each year—an autumn session of intensive character, commencing in September, and completed in early December, and a spring session, commencing in the middle of January and completed in the middle of April. Each course consists of two parts. Part A includes lectures and demonstrations on the anatomy, histology, and physiology of the nervous system, with lectures on psychology and demonstrations in experimental psychology. Part B comprises lectures and clinical demonstrations in psychology, including lectures and demonstrations in the morbid anatomy of the nervous system, a series of lectures, with clinical demonstrations on different branches of psychological medicine, and lectures, with clinical demonstrations, on mental deficiency. Entrants for the course who pay a composition fee of 15 guineas may if due notice is given, attend either Part A or Part B of one course and postpone the other part until the next session. An entrant who wishes to attend one part only pays a fee of 10 guineas. An entrant who takes the complete course can attend the general clinical practice of the hospital on payment of 5 guineas for six months or 10 guineas for one year but an entrant who does not take either part of the course and desires to attend the clinical practice of the hospital must pay a fee of 5 guineas for each three months of attendance. To enable post-graduates to obtain special experience in this branch of medicine clinical assistants are appointed from time to time. Further particulars may be obtained from the physician-superintendent, Bethlem Royal Hospital, S.E. 1.

NATIONAL HOSPITAL FOR THE PARALYSED AND EPILEPTIC, QUEEN SQUARE

A post-graduate course, which fulfilled the requirements of the regulations for the Diploma in Psychological Medicine in regard to instruction in nervous diseases, was held at the National Hospital for the Paralysed and Epileptic, Queen Square, Bloomsbury, W C 1, in May and June, 1924, and other courses will be duly announced Lectures on the pathology of the nervous system and various clinical lectures were delivered and demonstrations were given, and out-patient clinics were held at the hospital on the afternoons of Mondays, Tuesdays, Thursdays, and Fridays An inclusive fee of 9 guineas was charged for the whole course, but any part of the course could be taken separately at a special fee A special arrangement was made for those unable to attend the whole course, and for details applications should be made to the dean of the medical school Similar courses are held three times a year—namely, January, May, and October Special arrangements are made throughout the year for work in the laboratory Fees are payable to the secretary of the hospital on entering for the course

PUBLIC HEALTH SERVICES.

GENERAL CONSIDERATIONS

THE Public Health Service, to use the term in a strict sense, consists of medical officers of health appointed by local public health authorities and holding office under varying conditions of tenure In addition there are county medical officers appointed by the county councils The latter are not, strictly speaking, public health authorities, the duties of their medical officers are somewhat similar to those of other medical officers of health, but, in England, include few executive functions In many of the county boroughs and counties assistant medical officers of health or assistant county medical officers are appointed, and such appointments may afford stepping-stones for promotion to higher offices The service is, however, not unified throughout the country, and there is no regular system of promotion, appointments are to be obtained only by *application to some particular local authority which has* advertised a vacancy

Three other services, also ungraded, have been brought into existence by recent legislation, their members are charged with duties which bring them into more or less direct relation with public health authorities or county councils and their officers They are school medical officers, tuberculosis officers, and venereal disease medical officers Appointments as school medical officer are made by local education authorities, while appointments as tuberculosis officer and venereal disease officer are made by the county councils and the county borough councils

The medical department of the Ministry of Health for England has been organized under the control of a chief medical officer who has the status of an assistant secretary, it contains six sections, with a senior medical officer at the head of each These sections are concerned with general health and epidemiology, maternity and child welfare, tuberculosis and venereal disease, the supervision of food supplies, and sanitary administration in relation to infectious disease There is a separate section concerned with insurance practitioners Lastly, there are medical officers employed in the Poor Law department and several whose services are available for special purposes but who are not "established" officers Medical officers and medical inspectors are also employed by the Ministry or the corresponding Board in Wales and in Scotland Appointments to these posts are not open to public competition, they are made by the Minister of Health in England and Wales and by the corresponding head of the department in Scotland They are civil service appointments, and come under the superannuation scheme of the service

MEDICAL OFFICERS OF HEALTH IN ENGLAND AND WALES

The first appointments of medical officers of health were made for limited periods, the holder of the office having to risk re-election at the expiration of his term of office This pernicious practice, so far as it applies to whole-time officers, owing to the persistent endeavours of the British Medical Association, in co-operation with some other bodies, ceased to exist after April 1st, 1922, as regards medical officers of health appointed prior to May 1st, 1921, it is not in operation as regards those appointed after the latter date The Public Health (Officers) Act, 1921, which was promoted by the British Medical Association, provides that a whole-time medical officer of health shall not be appointed for a limited period, and shall not be removed from his office except with the consent of the Minister of Health This Act came into operation on April 1st, 1922, but an order of the Minister of Health dated April 12th, 1921, makes a similar provision with respect to those officers appointed after May 1st, 1921

A medical officer of health who does not devote his whole time to the duties of his office, and a portion of whose salary is obtained from Exchequer grants, may be appointed without limit of time, in which case he cannot be removed from office without the consent of the Minister of Health If he is appointed for a specified term, say one year, he continues to hold office from year to year unless the Minister consents to his removal or the electing authority gives him three months' notice to resign his office, but the notice must take effect at the same period of the year as that at which the original term of appointment expired Where the electing body pays the whole of the salary of a medical officer of health he may be dismissed from office without reference to the Minister of Health

A considerable number of authorities have now adopted the Local Government and other Officers' Superannuation Act, 1922, including medical officers of health, in the general provision made for their officers The Act is, however, permissive only, and fails to make due allowance by the addition of years in computing service for purposes of superannuation, for the relatively advanced age at which the medical officer of health must enter municipal service In those two respects the position reached under the Act falls short of that for which the British Medical Association has been working during the past twenty years

A medical officer of health of a county or of a district or combination of districts with a population of more than 50,000 persons must hold a diploma in public health This diploma is now generally required from all applicants for whole-time appointments of medical officers of health and assistant medical officers of health, and very frequently in the case of school medical officers, tuberculosis officers, and venereal disease officers A medical man who desires to enter the public health service as a career must as a first step obtain such a diploma

THE POSITION IN SCOTLAND

The above statement applies specially to England In Scotland the position is different in several respects The central authority is a Board of Health which has at present four members, with offices in Edinburgh One of the four is a medical man It is now proposed to reduce the membership to three as existing appointments expire, and to abolish the qualifications of future members, so that not one of the three need be medical [1] The "Board" system is the rule in central government north of the Tweed, there being also Boards of Agriculture, Fisheries, Education, and Control (of lunatics) The Secretary for Scotland, whose chief office is in Whitehall, is over all, and there is a Parliamentary Under Secretary Both of these are members of the Board, the Secretary for Scotland being President, the Under Secretary Vice-President, and one of the Edinburgh members Chairman The Board has a staff of medical officers for insurance work Under the Public Health (Scotland) Act, 1897, no one can be appointed as medical officer of health for any area, burghal or rural, however small, unless he possesses a diploma in public health One result is that small burghs often appoint the county M O H as their officer No medical officer or sanitary inspector can be removed from office except with the sanction of the Board of Health A "proper" salary must be paid, and it is incompetent for the local authority to bring about a resignation by indirect means, such as reducing a salary, or attaching conditions to the appoint-

[1] See BRITISH MEDICAL JOURNAL, August 16th, 1924, p 293

ment The Act says nothing about superannuation, and specifies no retiring age The appointment, however, is not *ad vitam aut culpam* Most counties in Scotland are smaller than in England, and the county medical officer is almost invariably also district medical officer, being therefore both administrative and executive in function A few counties are not divided into districts

The School Medical Service

School medical officers are appointed by local education authorities under schemes of medical inspection of school children which must be approved by the Board of Education Primarily their duty is to detect among the children attending the public elementary schools any physical or mental defect which may retard the education of such children and to inform their parents of its existence But practically their duties vary considerably in different areas This is because most approved schemes of inspection include systems at work which aim at facilitating the task of parents in obtaining for their children the necessary treatment, at checking the results of the latter, and at keeping each defective child under skilled observation both at home and at school until it has passed altogether out of the education authority's hands The general object of all schemes alike is to make the inspection imposed by law of benefit not merely to the individual child but to the community at large, by preventing conditions which lead to the existence of a large proportion of inefficient citizens among the adult population In short, the work is so far related to that of a medical officer of health that in most areas the senior school medical officer fills both appointments, his work, when necessary, being supplemented by that of whole- or part-time assistants Whole-time assistants who have obtained, as they should do, a diploma in public health, receive, in an increasing number of cases, salaries commencing at a minimum of £600 a year The chief attraction of the posts is that they may lead on to appointment as medical officer of health, but we fear that not many actually do reach that position In some counties and county boroughs it is now the practice for the officer to undertake certain minor ameliorative work, notably prescription of glasses when necessary, the removal of adenoids, and treatment in connexion with certain diseases of the skin The added interest thus given to the work appears to make for increased efficiency and also enhances the value of the post Otherwise the monotony of filling up record cards in the absence of any duty or treatment is apt to become intolerable and if no public health functions belong to the post it gives little chance of developing into a health officership

In Scotland, while the statutory authority for the work of the school medical service is different the effect is broadly the same Approval of schemes is vested in the Scottish Board of Health, which consults the Scottish Education Department in so far as that Department has an interest All schemes provide some facilities for treatment though the extent of these varies considerably, the industrial areas having on the whole the more complete service The larger education authorities employ their own whole time staff, though there is close co-operation with the medical officer of health's department In other areas the county medical officer of health may be chief school medical officer with whole time assistants either for all public health services or for school work alone, and in still others all these duties, administrative and executive, may devolve upon a single medical officer A diploma in public health is almost universally required in the school medical service

Tuberculosis Officers

Before sanatorium benefit was transferred to the public health authorities the prescribed duties of tuberculosis officers were to act as advisers to Insurance Committees in connexion with the operation of the National Insurance Act and to take charge of the work of the tuberculosis dispensary, which is the main unit of the Departmental Committee's scheme A tuberculosis officer is a whole-time officer, who should have special training in tuberculosis work, and be of suitable age and attainments to command general confidence In many instances he is now appointed on the staff of the medical officer of health, so that the work of prevention and cure of tuberculosis may be made part of the general health work of the Municipal Council The number of such appointments is still relatively small, and the salary generally attached to them is low, but progress is being made towards the general adoption of the British Medical Association's minimum of £750 a year for responsible officers For assistants the position is much the same as for assistant school medical officers

Tuberculosis officers in Scotland are appointed by public health local authorities or by tuberculosis authorities (that is, county councils acting under Section 91 of the National Insurance Act, 1913) to carry out the work of inspection and diagnosis of tuberculous patients to advise as to treatment, and to take charge of the work of tuberculosis dispensaries where these are in operation Work under tuberculosis schemes is as a rule co-ordinated with the general public health work of local authorities, and the medical officer of health of an area is either appointed as tuberculosis officer or has a special tuberculosis officer on his staff The number of appointments is small and the salary is usually about £500 to £600 a year, with bonus in some cases

Venereal Disease Medical Officers

Schemes for the diagnosis and treatment of venereal disease are administered by county councils and county borough councils A few of these authorities have appointed whole-time medical officers at a salary of £600 to £700 per annum In some cases the officer is an assistant on the staff of the medical officer of health and in others he is an independent official In the latter case the British Medical Association is attempting to secure the general adoption of a minimum salary of £750 per annum Specialized practical experience in the treatment of venereal disease is essential, and it is an advantage if such experience has been obtained in the navy or army His duties usually include not only the diagnosis and treatment of cases of venereal disease at one or more central clinics, but also the instruction and supervision of the treatment by general practitioners attached to local clinics

Diplomas in Public Health

New rules for study and examination for these diplomas came into force on January 1st 1924 Most of the universities and licensing corporations now grant diplomas in public health to candidates who pass the examinations imposed by them Since all such tests must conform to the requirements of the General Medical Council there is considerable similarity in their nature though they differ not a little in their reputed difficulty All of them aim at excluding any candidate who does not appear to have a thorough knowledge of his work in theory and in practice for the regulations of the General Medical Council demand that the granting of a diploma in sanitary science State medicine, or public health shall be proof of the possession of a distinctly high proficiency scientific and practical in all the branches of study which concern the public health" The tests, in short, are supposed to constitute an honours and not a mere pass examination As regards the special tuition required it is now easy to obtain this in practically every centre of medical education, and at almost every medical school of any importance It is desirable to note in this connexion that the chemical and bacteriological examinations for many of the health diplomas are so practical and the time allowed so short, that unless a candidate—even though familiar with the duties of M O H — has a considerable amount of manipulative dexterity only to be acquired by ample work in a laboratory he would not be likely to satisfy the examiners

The steps which examining bodies take to ascertain the candidate's fitness for a diploma are in all cases much the same, though the order in which the subjects are taken is not always identical Every candidate therefore should, when he has settled what diploma or degree in State medicine he wishes to obtain, seek the schedule relating to it from the authority concerned Certain number of the universities grant degrees in the subject as well as diplomas

The rules have applied since January 1st, 1924, and require that not less than two years shall elapse after obtaining a registrable qualification before admission to the Final Examination for a public health diploma The curriculum must extend over not less than twelve calendar

months At least five months must be given to practical laboratory instruction in an approved institution in (*a*) bacteriology and parasitology, including entomology, especially in relation to diseases of man and to those transmissible to man from the lower animals (180 hours), (*b*) chemistry and physics in relation to public health (90 hours), and (*c*) meteorology and climatology (10 hours) Not less than 80 hours' instruction in an approved institution, or by approved teachers, must be given to the following subjects, the approximate hours being as bracketed Principles of public health and sanitation (30), epidemiology and vital statistics (20), sanitary law and administration (20), sanitary construction and planning (10)

There is required three months' attendance—30 daily attendances of not less than two hours in each week—on the clinical practice of a recognized hospital for infectious diseases, with instruction in methods of administration Six months' practical training under a medical officer of health is an important feature of the new scheme, and the time cannot be reduced by attendance on lectures as at present Three hours on each of sixty working days are the minimum, and the instruction is to include maternity and child welfare, the services relating to school life, venereal disease and tuberculosis, industrial hygiene, and food, meat, and milk inspection

The examination will consist of two parts, each lasting for at least two days Part I covers bacteriology, parasitology (with medical entomology), chemistry, physics, meteorology, and climatology Part II includes hygiene and sanitation, epidemiology and infectious diseases, sanitary laws and vital statistics, and public health administration There will be practical examinations in infectious diseases, food inspection, and inspection of premises Neither part can be entered on until the relative courses of instruction (after registration in medicine) have been completed, and Part I must be passed before admission to Part II

A NOTE ON THE NEW D P H REGULATIONS

We find from inquiries which reach us that the new D P H regulations are not always being clearly understood It appears to have been suggested that an interval of not less than two years must elapse between the two parts of the examination That is not the case The whole of Part I must be passed before a candidate is admitted to Part II, but—subject, of course, to the arrangements of the diploma granting body as to dates of examinations, and subject to the full curriculum of study having been completed—a candidate can sit for Part II so soon as he has passed Part I The two years' interval required is between admission to the *Medical Register* and to Part II of the D P H examination This is, in fact, the re enactment of an obligation imposed by the University of Cambridge for its certificates in sanitary science before ever diplomas in public health were recognized by the General Medical Council Until the present year, when the new regulations came into force, no such rule existed for the registrable diploma, but in raising the whole standard of training for that purpose the Council adopted the old Cambridge requirement Its object, as explained in issuing the resolutions and rules, is "to provide opportunity for candidates for the Diploma or Degree in Sanitary Science, Public Health, or State Medicine, to pass from the state of pupilage to that of responsible practitioners, to give mature consideration to the obligations and duties involved in the work of the Public Health Service, and to acquire direct experience of medical work in a responsible capacity either in practice or in hospital or laboratory appointments The Council believe that, in the public interest, the time has arrived to adapt the diploma to candidates who are seriously intending to take up public health work as a career" As regards the curriculum, it should perhaps be made clear that the Council does not require the whole of it to be taken before Part I of the examination The rule on that point is that "candidates may not be admitted to examination for Part I until after they have completed the prescribed courses of instruction in the subjects thereof" An identical rule applies to Part II Also, as already indicated, "a candidate must pass in all the subjects of Part I before being admitted to examination for Part II" Other questions which have been asked relate to possible candidates from the Dominions A candidate would be eligible for the Final Examination for the D P H two years after obtaining in a Dominion a qualification registrable here, but an unregistrable qualification would be of no avail Finally, an important point is whether a duly qualified man could take the D P H curriculum elsewhere than in this country The answer would appear to depend on the facts of the individual case The Diploma in Public Health is intended to qualify for the work of a medical officer of health in this country If the training elsewhere were such as to meet this requirement it seems reasonable to believe that the curriculum would be accepted, but an application would have to be submitted to the General Medical Council Importance would attach to the practicability of obtaining training in the infectious diseases which prevail here It would suppose, for example, that public health work in Toronto or Montreal or Melbourne or Sydney would sufficiently resemble that of Britain to meet the Council's standards, but the safe course would be to make sure by inquiry before beginning the curriculum

THE PUBLIC SERVICES.

THE ARMY, AIR FORCE, AND INDIAN MEDICAL SERVICES

THE Medical Departments of the Royal Navy, of the Army, and the Indian Government normally employed between them before the war some 3,000 medical men, and vacancies in the ranks of these services were filled by offering commissions for competition once or more each year In the abnormal circumstances arising out of the war and the period immediately following it the usual regulations for recruiting the permanent medical staff of these services were, for the most part, in abeyance Now that a return has been made to peace establishments we publish somewhat fuller information than we gave during the war period, for the guidance of those junior members of the profession who think of applying for regular commissions in the Royal Air Force Medical Service and the Royal Army Medical Corps Further details should be sought from the respective medical departments The information formerly given regarding the conditions of service, pay, and prospects in the Medical Department of the Royal Navy has again been omitted for the reasons stated at page 445

ARMY MEDICAL SERVICE

Competitive examinations for commissions into the Royal Army Medical Corps are held twice a year, usually in January and July

The prospects of the newly qualified medical man taking up the army as a career have been improved by changes that have come into force since the war The rates of pay and pension are given in the subjoined tables

Royal Army Medical Corps

* Pay Warrant rates less 5½ per cent from July 1st 1921 (vide Army Orders 93 and 204 of 1921) The Pay Warrant rates when granted were made subject to revision to an extent not exceeding 20 per cent according to variations in the cost of living The next revision takes place from July 1st 1927

† Rates of Allowance vary from time to time and issues are subject to conditions laid down in the Allowance Regulations

At Home—An officer not above the rank of lieutenant-colonel holding an appointment as specialist receives 2s 6d or 5s a day (according to subject or group of subjects). An officer in charge of a hospital receives charge pay the daily amounts being in excess of 50 beds 2s 6d in excess of 100 5s in excess of 200 7s 6d in excess of 300 10s. An officer in charge of a medical or surgical division of a general hospital with not less than 600 beds receives half the above rates. Senior Medical Officer Royal Arsenal no exceeding 10s a day. Officer in Command of the Depot R A M C 5s daily. Adjutant R A M C Depot 2s daily. Adjutant R A M C (T A) 2s 6d daily. Professors at the Royal Army Medical College receive £200 and assistant professors £60 a year in addition to pay and allowance of their rank.

In India—The specialist pay is 60 rupees a month. Charge pay is from 60 to 240 rupees a month according to the size of hospital.

Retirement

A lieutenant general or major general must retire on attaining the age of 60 years, a colonel at 57 and other officers at 55. A major superseded for promotion retires on the completion of twenty five years service or, if he fails to qualify for promotion on the completion of twenty years service. A captain who fails to pass the examination for promotion to major on a second trial must retire at once with any gratuity for which he may be eligible or if not on completing five years service as a captain. A lieutenant who does not qualify for promotion within three and a half years is required to resign. A candidate who has been specially employed in consequence of a national emergency either as an officer or in a position usually filled by an officer will be allowed to reckon such service towards retired pay and gratuity provided there has not been an interval of more than five years before appointment to a regular commission. The maximum rates of retired pay are as follows:

	£ s
Captain and Subaltern	283 10
Major	425 10
Lieutenant-colonel	567 0
Colonel	756 0
Major General	945 0
Lieutenant General	1134 0

Voluntary retirement on retired pay is not allowed until after twenty years service. Earlier retirement on gratuity is allowed as follows:

Major or Captain	Gratuity
After 8½ years commissioned service as a medical officer	£1,000
3 years service in the rank of major as a medical officer	£1,800
6 years service in the rank of major as a medical officer	£2,500

Seconded Service

An officer may be permitted to accept employment in the Foreign or Colonial Offices when so seconded he is not eligible for pay or allowances from army funds but his service continues to reckon towards promotion and under certain conditions towards increase of pay pension or gratuity. Among the capacities in which R A M C officers may be employed are:

(1) The medical service of the Egyptian Army.
(2) The sanitary service of the Egyptian Government.
(3) The medical services of the various foreign and colonial Governments.

Service on the West Coast of Africa

Officers for service in West Africa are usually taken from a list of volunteers for such service. An officer at present receives while actually serving in West Africa (which service may include ordinary leave not exceeding sixty-one days in a year and any time spent at Madeira or the Canary Islands on sick leave) additional pay at the following daily rates: lieutenant-colonel 12s, major 9s, captain 7s 6d, lieutenant 6s.

The professional work of the corps has received a great impetus through the Directorates of Hygiene and Pathology. Specially selected and trained officers have now been appointed as assistant and deputy assistant directors of hygiene to all commands and garrisons at home and abroad. Junior officers appointed on probation undergo a course of instruction in hygiene at the army school of hygiene where lectures and demonstrations are given on the methods of sanitation, including entomology applicable to the various climates and countries, special attention being paid to *tropical hygiene*.

The Directorate of Pathology offers many attractions to those officers who are desirous of taking up the scientific side of medicine. Officers who show aptitude *in this direction* are encouraged to continue their scientific studies during the whole course of their service. As junior officers the posts of *clinical pathologists* to hospitals at home and abroad are available while, after their first tour of *foreign* service they are given the opportunity of qualifying as specialists in bacteriology and pathology at the Royal Army Medical College, having so qualified they become eligible for the appointments of assistant or deputy assistant director of pathology, posts which carry with them specialist pay or temporary promotion.

Appointments to the staff of the Directorate of Hygiene or Pathology at the War Office are open to officers who have served in these scientific branches—the senior posts carrying the rank of colonel or major general as the case may be. All such staff appointments, either at the War Office or in commands at home, have a fixed tenure of three or four years *should the exigencies* of the service permit.

Arrangements have been made for the appointment of consultants in both medicine and surgery, and the ranks of colonel and major general are now open to such officers. This will encourage officers of outstanding ability in these subjects to continue to devote their attention to medicine and surgery, in which previously there were no openings for officers above the seniority of lieutenant-colonel.

The question of specialists has also undergone revision and a great improvement in the method of training and selection has been effected. Captains undergo a five months' course at the Royal Army Medical College for promotion to major in the subjects of hygiene and pathology together with *general medicine and surgery*. Of *those officers who* pass the Combined Examination in these subjects the first 50 per cent are now eligible to take out a further four months' specialist training, provided that they can prove to have had past experience in a particular subject and to have shown special aptitude for that subject. Results so far achieved by this system have, we are informed, been most encouraging. The training is undertaken by selected teachers of the various London general hospitals, as well as the army professors at the college.

It is recognized that, apart from purely professional work, officers should receive administrative training. Many appointments of an administrative character are open to officers who show zeal and capacity for this side of the army medical officer's duties.

ROYAL AIR FORCE MEDICAL SERVICE

THE Royal Air Force Medical Service offers a career for medical men which should prove both attractive and interesting. The *rates of pay and allowances* are good, and a new field of scientific interest is opened up by the manifold problems which the circumstances of aviation produce. The physical and mental fitness for, and reaction to, the varied conditions under which the flying personnel perform their functions provide much scope for research.

As promotion to the higher ranks of the service is by selection, and as a certain proportion of the higher ranks will be reserved for purely scientific as opposed to administrative appointments, it will be seen that there are excellent prospects for the young medical officer who exhibits ability and energy in scientific research, as well as for those who develop a talent for administration.

Commissions

The establishment will consist partly of permanent and partly of short service officers.

An officer will on first entry be granted a short service commission for a period of two years *on the active list* (which may be extended to four years at the discretion of the Air Council on the recommendation of the Director of Medical Services) and of four years in the Reserve of Air Force Officers. (The periods of service on the active list are under review.) Selections for permanent commissions will be made from officers holding short service commissions and those who are not selected will be transferred to the Reserve at the expiration of their period of service on the active list.

Short service officers who are approved for permanent commissions but for whom there are not vacancies in the Royal Air Force Medical Service, may under certain conditions be considered for transfer to the Royal Army Medical Corps. If transferred, their service in the Royal Air Force Medical Service would count towards increments of pay and towards retired pay in the Royal Army Medical Corps.

Officers who have been selected for permanent commissions may be granted leave for a period not exceeding nine months for post graduate study in general medicine and surgery, *tropical and preventive medicine* and other special subjects. Such leave will be granted during the first six years of permanent service and during such leave officers will receive full pay and allowances.

New entrants into the Royal Air Force Medical Service will be commissioned as Flying Officers (Medical) and will be eligible for promotion to the rank of Flight Lieutenant (Medical) after two years service. Officers selected for permanent commissions will be promoted to the rank of Squadron Leader after ten years total service. Accelerated promotion may be carried out in a limited number of cases of officers who show exceptional ability *after the completion* of eight years service. Promotion within establishment to the

M = Married S = Single

rank of Wing Commander will be by selection at any period after sixteen years total service, and to that of Group Captain by selection at any period after twenty two years' service

There will be no competitive examination on entry, candidates must be under 28 years of age, be British subjects, the sons of British subjects, and of pure European descent, be nominated by the dean of a recognized medical school or teaching hospital, and will be interviewed personally by the Director of Medical Services, Royal Air Force, before acceptance Each candidate must produce

1 Birth certificate
2 Medical registration certificate
3 A declaration containing the following information (*a*) Age, and place of birth (*b*) That he is a British subject, the son of British subjects and of pure European descent (*c*) That he is ready to engage for general service at home or abroad as required (*d*) The qualifications he is possessed of and what medical or other appointments he has held (if any) (*e*) That he is willing to fly whenever called upon to do so

Each candidate will be required, before acceptance, to pass a medical examination to ensure that he labours under no constitutional or mental disease or diseases or weakness, nor any imperfection or disability which may interfere with the efficient discharge of the duties of a medical officer in any climate, in peace or war

An officer granted a short service commission who, at the time of application for such commission held or was about to hold a resident appointment in a recognized civil hospital, may be seconded for the period not exceeding one year from the date of the commission during which he shall hold such appointment Whilst seconded he will not receive pay from the Air Ministry funds, but the period of secondment will otherwise count as service in the Royal Air Force, provided that he will be required to serve for a minimum period of two years on the active list from the date on which he ceases to be so seconded

Uniform and Equipment

Medical officers will be required to provide themselves with the uniform of their rank, and with the distinguishing badges of the Royal Air Force Medical Service They will be required to provide themselves with service dress and mess dress The provision of full dress is entirely optional at present An allowance of £50 will be made towards the cost of uniform for officers who have not previously held commissions in the Royal Navy, the Army, the Indian Army, the Royal Marines, or the Royal Air Force or any of the auxiliaries of these forces An allowance of £25 will be made for officers with previous commissioned service in the Royal Navy, the Army, the Indian Army, the Royal Marines, or any of the auxiliaries of these forces, but not in the Royal Air Force or its auxiliaries

Rates of Pay

The rates of pay are given in Table I, and the standard scale of retired pay for Group Captains and lower ranks in Table II

TABLE II.—*The Standard Scale of Retired Pay for Group Captains and Lower Ranks*

Age	Service counting for Retired Pay	Standard Rate of Retired Pay	Addition for each Extra Year of Service*	Reduction for each Deficient Year of Service*	Age	Service counting for Retired Pay	Standard Rate of Retired Pay	Addition for each Extra Year of Service*	Reduction for each Deficient Year of Service*
		£	£	£			£	£	£
55	24	700	22	15	47	20	562	15	15
54	24	765	22	15	46	20	525	15	15
53	23	742	22	15	45	19	487	15	15
52	23	720	22	15	44	19	450	15	15
51	22	697	22	15	43	18	412	15	15
50	22	675	15	15	42	18	375	15	15
49	21	637	15	15	41	17	337	15	15
48	21	600	15	15	40	17	300	15	15

* Limited to five years

The rates of pay (Table I) are liable to revision The standard rates were drawn up in 1919 in the light of the then high cost of living, and 20 per cent of each of the standard rates is regarded as detachable and subject to alteration either upwards or downwards as the cost of living rises or falls The first revision took effect from July 1st 1924, when a reduction of approximately 5½ per cent was made in the standard rates Subsequent revision will be made at intervals of three years

It must, however, be clearly understood that while every consideration will be given to the reasonable and legitimate interests of individuals, it will be competent for the Air Council at any time to modify the regulations under which the emoluments of the Royal Air Force are drawn and no officer will be entitled to claim any pay, gratuity or other advantage conferred by a provision being at any time added to, varied, or cancelled

For the purpose of the issue of allowances a "married officer" is one who is married and has attained the age of 30 or the substantive rank of Squadron Leader, or who irrespective of age and rank was married on or before September 15th, 1919, and was serving in the Royal Air Force on June 8th, 1922

As allowances are given for specific purposes, the cost of which may vary at comparatively short intervals, the rates of allowances are liable to be reviewed as circumstances may require

A colonial allowance is granted in certain commands abroad in aid of the expenses of living in the countries where the cost is higher than in the United Kingdom

For periods of service given under Indian administration and payment officers will come under the rates and conditions authorized from time to time by the Indian Government in so far as these rates and conditions may differ from those in this scheme The Indian rates are at present under review

Group Captains retire at 55—maximum retired pay £900 Wing Commanders retire at 51—maximum retired pay £600 Squadron Leaders retire at 48—maximum retired pay £500 There will be a minimum qualifying period for retired pay of twenty years

The rates of retired pay (Table II) (including the maximum rates) are standard rates which will be subject to revision as follows 20 per cent of each of the standard rates will be regarded as detachable and subject to alteration upwards or downwards as the cost of living rises or falls The first revision took effect from July 1st 1924 when a reduction of approximately 5½ per cent was made subsequent revisions will be made at intervals of three years The revision will apply to all retired pay which is being drawn at the date of revision as well as to subsequent awards

Gratuities—Short service officers will receive gratuities on the scale of £100 for each of the first two complete years of service and £150 for each of the third and fourth complete year The gratuities will not be payable to officers granted permanent commissions but the period of service under the short service commission will count for retired pay Medical officers holding permanent commissions may at the discretion of the Air Council be allowed to withdraw from the service after ten years service with a gratuity of £1 250 or after sixteen years with a gratuity of £2 000 in lieu of retired pay

Allowances—The usual allowances will be payable to medical officers under the same conditions as to officers of other branches of the Royal Air Force

INDIAN MEDICAL SERVICE

THE Indian Medical Service is closed to new admissions, for the present at least, perhaps permanently It is therefore impossible to give any information to men who might otherwise have sought to enter that service

The Lee Commission which visited India last winter to consider and report on the prospects and remuneration of the European services in India issued its report in May As regards the I M S it recommended that the work hitherto carried on by that service so far as it deals with the army and the other European services should be handed over to a special branch of the R A M C to be entitled R.A M C (India) Presumably the members of the I.M.S now serving would be absorbed into this new service which would in future be recruited by men from the R A M C volunteering for service either temporarily or permanently in India the greater part of the civil work at present carried on by the I M S would then be entrusted to provincial civil medical services recruited entirely in India This would cut off most of the civil surgeoncies hitherto held by the I M S probably three-quarters of the whole leaving only a few of the most important stations in each province with I M S civil surgeons the professorships in the Indian medical colleges would be thrown open to the whole profession in India In any case, the recommendations of the Lee Commission if adopted mean the end of the I M S It must be remembered however that so far the report of this Commission consists of recommendations only Its proposals still have to come before and gain the approval of the Indian Legislature the Secretary of State and the House of Commons

THE ROYAL NAVAL MEDICAL SERVICE

IN January 1920, new regulations for retirement of officers came into force in the Royal Navy and new rates of pay were laid down The new regulations inflicted a great injustice upon a considerable number of surgeon commanders who were nearing, or had passed the new retiring age The grievances arose under two heads—age of retirement and rate of pension—and frequent remonstrances were addressed to the Admiralty by the British Medical Association [1]

Very briefly stated, these medical officers, who had entered the service on the understanding that they would be allowed to serve until the age of 55, were compulsorily retired at 50, and their maximum pension was fixed at £600 a year, representing an increase of but 10 per cent on the former retired pay of their rank, it should be particularly observed that officers of other branches got increases of pension varying from 26 to 100 per cent In reply to representations by the British Medical Association the Admiralty admitted the grievance, but declined to remedy it The Council of the Association at length warned the Admiralty that if the question could not be settled satisfactorily it would be obliged to place the facts before the profession, and to advise medical students and young practitioners to consider seriously the disadvantages to which they were liable if they placed their careers in the hands of the Admiralty

The outstanding grievance in the Royal Naval Medical Service is undoubtedly that of the treatment of the senior surgeon commanders In approaching the Admiralty this year on the shortage of candidates for the R N M S the British Medical Association made it quite clear that it would do nothing to help the Admiralty to obtain candidates until this question had been satisfactorily settled On January 29th the Admiralty at last met representatives of the Association and discussed the whole matter At the interview the Admiralty was represented by the Medical Director-General, the Deputy Secretary of the Admiralty, and the D D G, R N M S After an assurance had been given that the senior surgeon commander question would be gone into, certain suggestions for popularizing the service were put forward by the deputation The views of the Association are now under consideration by the Board of Admiralty, and the Council hopes that the Admiralty will shortly be able to make a satisfactory settlement The matter was followed up when the House of Commons was discussing the Navy Estimates, when Dr G F Spero, M P, gave an able exposition of the grievances of the profession in regard to the navy It may be hoped, therefore, that before next year's Educational Number appears the Admiralty will have put itself right in the eyes of the medical profession In that event we shall be able to include once again a statement of the conditions under which commissions are granted in the Medical Department of the Royal Navy and in other ways give encouragement to prospective candidates

PRISON MEDICAL SERVICE

CANDIDATES for the medical staff are approved by the Secretary of State for the Home Office on the recommendation of the Prison Commissioners The Chairman of the Board is M L Waller, Esq C B Application for employment may be made to the Board on a special form, which can be obtained from the Secretary, Prison Commission, Home Office, London, S W 1

In the smaller prisons the medical officer is usually a local practitioner, but in the larger the members of the medical staff are required to devote their whole time to the service In the case of those required to give their whole time to the service the appointment in the first instance is to the post of medical officer Class II, and from the seniors of this rank the medical officers Class I are selected as vacancies occur

In February 1923, the then Home Secretary appointed a committee to report on what changes, if any, should be made in the remuneration or other conditions of service of officers at the prisons and Borstal institutions in England and Scotland and at Broadmoor Criminal Lunatic Asylum Evidence was given on behalf of the British Medical Association by the Medical Secretary who pointed out that the salary offered to Class II medical officers—namely, a basic salary of £300 rising by annual increment—was, even when the allowances and bonus were reckoned in, less than the £500 a year the Association looked upon as the minimum commencing salary which should be given to a whole-time medical man holding such a responsible office The committee issued its report in November, 1923 It recommended that officers of both classes should receive an additional £50 a year and from a communication received from the Prison Commission we understand that the pay of the whole time prison medical staff is Medical officer Class II, £350 rising by annual increments of £20 to £600 medical officer Class I, £650, rising by annual increments of £25 to £800 Unfurnished quarters are provided, or an allowance in lieu is made The Civil Service bonus is paid on the salary There are 14 medical officers Class II, 12 medical officers Class I, and 27 part-time medical officers

The number of vacancies is never large, and promotion is

[1] See BRITISH MEDICAL JOURNAL July 9th 1922, p 52

MEDICAL PRACTICE IN BRITISH DOMINIONS AND FOREIGN COUNTRIES

MEDICAL Acts have now been passed in almost all places forming part of the British Empire beyond the seas, and registers of duly qualified practitioners are consequently maintained. To these registers medical men educated in the United Kingdom are always admissible merely on payment of a registration fee, providing they produce evidence that they are of good repute and are either registered or eligible for registration in the United Kingdom, as the local requirement may be. The only exception to this statement that need be made relates to the Dominion of Canada. Each of its provinces acts in medical matters as an independent State. The result has been that reciprocity of practice has been established between this country and all the provinces of Canada except British Columbia, where certain obstacles still remain to be overcome. We would advise any medical man proposing to practise in Canada first to communicate with the Provincial Registrar, stating what degrees or diplomas he holds, and asking for information as to the precise steps he must take in order to obtain admission to the Provincial Register.

Italy and Japan are the only two foreign States with which complete medical reciprocity has been established, though there are other countries which grant a limited recognition to British qualifications. Generally speaking, in Continental countries (with the exception of the kingdom of Italy) a British medical man desiring to exercise his profession therein must pass practically the same examinations as those imposed on natives of the country. The same observation applies to all foreign States in the South American continent. Each of the United States of North America has its own laws and regulations governing medical practice, some of the States admit any holder of a degree or diploma to their Register, but the majority require a candidate for registration to submit to an examination.

A pamphlet showing the conditions under which medical and dental practitioners legally qualified in their own country may practise abroad can be obtained from the office of the General Medical Council, 44, Hallam Street, Portland Place, London, W.1, price 2s. 6d., or 2s. 9d. post free in the United Kingdom. Practitioners who think of going abroad to practise will find therein much useful information, including the name of the official in each country to whom requests for further particulars should be addressed. The last edition was published in January, 1921.

MEDICAL APPOINTMENTS UNDER THE COLONIAL OFFICE

APPOINTMENTS to the Medical Services of the Colonies and Protectorates under the administrative control of the Colonial Office are made by the Secretary of State for the Colonies. Such appointments are to the service of a given colony or colonies, for there is no unified service directly administered from the Colonial Office. It follows that conditions of service and superannuation are in the main determined by the economic resources and general public health policy of the individual colony and its local Government, and vary almost as widely as do conditions of climate. Moreover, the extent of the control exercised by the Colonial Office varies according to the constitutional status of the particular colony, and the detailed information available centrally is not always complete. The intending candidate, therefore, should make comprehensive inquiries as to local conditions before applying for an appointment, and will do well to supplement official information by reference to the central office of the British Medical Association, where reports obtained from time to time from the local Branches are available. This is the more necessary because facilities for transfer from the Medical Service of one colony or group of colonies to that of another are as yet practically non-existent, except in connexion with a few specialist and senior appointments, this sets strict limits upon the opportunities for promotion.

The bulk of the medical appointments made by the Secretary of State in this country are to the Services in the East and West African Colonies and Protectorates, the Straits Settlements and Malay States, the East Indies, and Fiji and the Western Pacific. In general, candidates for such appointments must be between the ages of 23 and 35, and whilst these limits are not for the moment absolute, an officer over 35 years of age on first appointment may be required to serve on a temporary and non-pensionable footing. Regular appointments are, subject to a varying period of probation, for the most part, nominally at least, permanent and pensionable. There is no entrance examination, but practitioners selected for appointment must obtain a certificate of physical fitness from one of the Medical Advisers of the Colonial Office. In the case of the West African Medical Staff and the East African Services successful candidates are required to undergo an approved course of instruction in tropical medicine.

Colonial Service: The General Outlook

While colonial service offers undoubted attractions to some practitioners it also presents very definite disadvantages, and not the least of these is, at the present time, uncertainty as to the future. Before the war, conditions in several of the Services gave rise to considerable anxiety, the greatly enhanced cost of living during the war resulted in certain more or less inadequate temporary advances in remuneration, but consideration of the radical reforms required was postponed until the succeeding period of reconstruction. In 1919 a departmental committee under the chairmanship of Sir Walter Egerton was appointed to consider the position of the Services generally, the means of securing contentment within them, and the maintenance and increase of the supply of candidates. The committee found that the ideal to be aimed at was the creation of a unified Colonial Service, recruited by competitive examination and represented on the staff of the Colonial Office by a Medical Director-General. As an immediately practicable step in this direction it recommended the assimilation of the Medical Services in neighbouring colonies, and more especially those in the East African and Malayan groups. A permanent increase of salaries with a general minimum of not less than £600 a year on first appointment was recommended, the necessity for study leave was recognized, as was the need for the development of facilities for research, an increase in the number of specialist appointments and adequate provision for promotion by transfer from the service of one colony or group to that of another were other points emphasized.

Progress along the lines laid down by the departmental committee, which correspond broadly to the policy adopted by the British Medical Association, has undoubtedly been made since the report of the committee was issued. With the exception of the West Indian Services, the Fiji and Pacific Colonies, and a few of the smaller dependencies which each offer only one or two medical appointments, the adoption of the £600 minimum or its equivalent in local currency has been achieved. The commencing pay in the West African Medical Staff is £660 a year. For all practical purposes the Services in the Malay Peninsula have been unified, and some steps have been taken towards the assimilation of the East African Services, whilst there has been an appreciable increase in the number of specialist appointments and the facilities for research. In general, conditions of service in West and East Africa may be taken as satisfactory, although in some instances an increase of staff appears desirable. Certain Services, notably those in the West Indies and Fiji, have not yet secured that measure of reform essential to a minimal standard of efficiency.

Moreover, the acute economic depression of the last four years has affected many of the colonies with almost crushing severity. It has in some cases brought about the indefinite postponement of projected reform, and in others it has practically neutralized advances in remuneration that were at

one time thought to be permanent, besides imposing disastrous restrictions on the public health programme in many places, and reductions in the medical personnel of the Services Nor do economic difficulties, radical though they are, stand alone The constitutional status of the colonies is under review Schemes for regrouping and for the concession of greater local autonomy may be temporarily delayed pending economic recovery, but it is not unreasonable to suppose that until such questions are settled there can be little progress towards the unification of the Colonial Medical Service Their adoption, on the other hand, may entail the formulation of a new solution for the admitted difficulties

The condition of the Colonial Medical Services has for some time been a matter of the gravest concern to the British Medical Association, which gave evidence on the subject before the Egerton Committee, and has been in constant communication with the Colonial Office on matters touching their welfare since August, 1921 During this period the Association has, in effect, been recognized as the mouthpiece of the Services, and has received copies of all official documents primarily affecting medical officers, and also the gazettes of the various local Governments It has therefore been possible to supplement the activities of the Overseas Branches by the exercise centrally of unceasing vigilance over all tendencies likely to affect the development of the Colonial Services Present conditions render advance impracticable in certain branches of the Colonial service, and especially is this so in the Windward Islands, where three years of unremitting effort on the part of the British Medical Association, both centrally and locally, ended in 1923 in failure The Representative Body of the Association, after full consideration of the facts of the case, and with a due sense of the responsibility involved in any action tending to hinder the supply of qualified candidates for the Services in these islands passed at Portsmouth a resolution regretting that the Colonial Office had declined to press the claims of the Windward Islands medical officers with regard to their terms and conditions of service, and thoroughly endorsing the action taken by the Council in support of those claims Such a resolution is the best possible commentary upon the opinion expressed in the BRITISH MEDICAL JOURNAL of June 30th, 1923, that no qualified medical practitioner aware of the conditions of service will accept an appointment in these islands The position in this respect has not been bettered by the modification of the local Medical Ordinance to permit the employment of practitioners not qualified for admission to the *Medical Register* of the United Kingdom

Official Sources of Information

All inquiries in connexion with colonial medical appointments made by the Secretary of State for the Colonies should be addressed to the Assistant Private Secretary (Appointments), Colonial Office, Downing Street, London, S W 1 Any vacancies occurring in Iraq, Palestine, and Aden are recruited through the Colonial Office, and information can be obtained at the same address Vacancies also occur, though at rare intervals, in the Sudan, and inquiries as to these should be addressed direct to the Civil Secretary Sudan Government, Khartoum Inquiries about any medical appointments made by the Egyptian Government should be addressed to the Director General, Public Health Department, Cairo

Information as to medical appointments in the self-governing Dominions and their dependencies can be *obtained on* application to the High Commissioners or Agents-General for the Dominions Intending applicants are also recommended to consult the Colonial Office List and the Professional Handbook (price 6d) issued by the Overseas Settlement Office, 6, St James's Square, London, S W 1

There remain a number of medical appointments made by mining companies and other commercial undertakings in various parts of the tropics Much caution should be exercised in accepting such posts, and the form of contract should be subjected to very careful scrutiny Advice in this connexion should always be sought *from* the Medical Secretary's Department of the British Medical Association, 429, Strand, London, W C 2

MEDICAL RADIOLOGY AND ELECTROLOGY

THE CAMBRIDGE DIPLOMA

A DIPLOMA in Medical Radiology and Electrology is granted by the University of Cambridge The primary object is to provide adequate training in a branch of medical work which is becoming increasingly important and difficult, and which is outside the ordinary medical curriculum The Diploma is open only to those who hold a medical qualification and includes a course of lectures and practical work in Physics (*Part I*) *and in Radiology* and Electrology (Part II) Attendance at the necessary courses of lectures in both subjects, and in addition six months' clinical experience in an adequately equipped hospital recognized by the committee, is essential The whole course of study takes six months the lectures practical work, and hospital attendance running concurrently

The courses carried out by the University of Cambridge are at present arranged to begin early in January Three months are spent in Cambridge doing the lectures and practical work in Part I, and attending the systematic lectures in Part II and the practice of Addenbrooke's Hospital, where there is a fully equipped and up-to-date x-ray and electrological department The remaining three months can be completed at any recognized hospital, but special arrangements are made for students to continue their studies in London, where demonstrations at various hospitals are arranged, in order to give a wide experience

In addition, an *independent course is arranged* by the British Institute of Radiology This course is held entirely in London, but is recognized by the University as qualifying for the examination, it begins early in October

Further particulars as to the Cambridge courses can be obtained from F Shillington Scales M A , M D Medical Schools Cambridge and of the London courses from Stanley Melville, M D , at the offices of the British Institute of Radiology, 32, Welbeck Street, London, W 1

MEDICAL MISSIONARIES

Missionary Societies are in constant need of qualified men and women to fill vacancies as they occur in their hospitals, and also to enable them to take advantage of fresh openings To those suitably endowed the mission field offers unique opportunities for interesting work, and the development of native medical schools as training *institutions in connexion with some of the larger mission* hospitals, affords excellent scope for valuable work to medical men and women who are qualified to teach It is not usually expected that medical missionaries should take a position such as would otherwise be occupied by an ordained clergyman or minister, but it is essential that they should be prepared to exert their influence in any hospital to which they may be sent so that a Christian atmosphere may be maintained and the work of evangelization be carried on through the ministry of healing

As for scientific and other qualifications for the work medical missionaries in addition to being physically capable of sustaining a life which makes a great demand upon their strength should be thoroughly well trained physicians and surgeons It is very desirable that they should have held a resident appointment at a general hospital, and have a good knowledge of practical surgery, gynaecology, tropical medicine, and the treatment of eye diseases Useful information can be obtained from the secretaries of the various Missionary Societies, or from Thomas Cochrane, M B , C M , Honorary Secretary, British Advisory Board on Medical Missions, 3, Tudor Street, London, E C 4

Dental Surgery.

UNTIL the passing of the Dentists Act, 1921, the profession of dentistry in this country was regulated by enactments very closely similar to those relating to the practice of medicine—that is to say, there was no direct prohibition of the act of practice, and the Dentists Act of 1878 gave the same degree of protection to legally qualified and registered dentists as was accorded to registered medical practitioners—namely, the reservation of the use of certain titles This Act also provided (1) that no person should take or use the name or title of "dentist" (either alone or in combination with any other word or words) or of "dental practitioner," or any other name, title, or description expressed in words or by letters implying that he was specially qualified to practise dentistry, unless he was registered, under a penalty of £20, and (2) that an unregistered person could not recover any fee or charge in respect of any dental operation, attendance, or advice But, in the case of the practice of medicine by unqualified and unregistered persons, certain deterrent factors came into play—such as the inability to give a death certificate —and these did not operate to the same extent in the case of dentistry, hence, unqualified practice has been far more prevalent in dentistry than in medicine, and this increased after a decision of the House of Lords placing a narrow interpretation upon the words "specially qualified to practise dentistry," by defining the word "qualified" as not referring to competence but to the possession of a recognized diploma

THE DENTISTS ACT, 1921

This unsatisfactory position has now been remedied by the passing into law of the Dentists Act, 1921, its provisions are based largely on the recommendations of a departmental committee appointed in 1917 by the Privy Council "to investigate the extent and gravity of the evils connected with the practice of dentistry and dental surgery by persons not qualified under the Dentists Act" Since November 30th, 1922, no person has been permitted by law to practise or hold himself out, whether directly or by implication, as practising or as being prepared to practise dentistry unless he is on the *Dentists Register* provided for by the Dentists Act, 1878 The practice of dentistry is defined as including "the performance of any such operation and the giving of any such treatment, advice, or attendance, as is usually performed or given by dentists," and the performing of any operation or the giving of any "treatment, advice, or attendance on or to any person as preparatory to or for the purpose of or in connexion with the fitting, insertion, or fixing of artificial teeth" The maximum penalty incurred by an unregistered dentist is £100 for each offence There are, however, certain important exceptions to the requirement of registration A registered medical practitioner may practise dentistry without being on the Dentists Register, and a registered pharmaceutical chemist or chemist and druggist may extract a tooth where the case is urgent and where no doctor or dentist is available, but the operation must be performed without any kind of anæsthetic, further, any person may carry out minor dental work in a public dental service under the personal supervision of a registered dentist provided it is in accordance with conditions approved by the Minister of Health after consultation with the Dental Board

Certain persons other than those qualified by examination were entitled to be registered under the new Act They had to be of good personal character and 23 years of age before July 28th, 1921 (the commencement of the Act), and to have been engaged for five of the seven years preceding that date as their principal means of livelihood in the practice of dentistry in the British Isles or have been admitted to membership of the Incorporated Dental Society not less than one year before the commencement of the Act The passing of "the prescribed examination in Dentistry" within two years of the commencement of the Act is considered as equivalent to practising for five years, and a registered pharmaceutical chemist or a chemist and druggist who immediately before the commencement of the Act had a substantial practice as a dentist including all dental operations, was treated as though he had practised for five years A dental mechanic who for the five years has been carrying on his work as such can be registered provided within ten years of the commencement of the Act he passed the prescribed examination

Dentistry may be carried on by a corporate body provided the majority of the directors and all the operating staff are registered dentists, and that no other business than dentistry or only some business ancillary to dentistry is carried on by the company Companies carrying on the business of dentistry at the present time are permitted to continue to do so with certain restrictions, provided that the names of the directors have been entered in a list kept by the Registrar for that purpose Every director or manager of a company convicted of an offence under the Act will be held to be guilty of the offence unless he proves that the offence was committed without his knowledge, and the court may, in addition to a fine, order that the name of any director convicted shall be removed from the list of directors aforesaid

A subsequent Act passed in 1923 made provision for the registration of persons who were 21 in November, 1921, who had served during the late war in His Majesty's Forces, and were on that date engaged as their principal means of livelihood in the practice of dentistry in the British Isles The Board, however, has now power to consider any further applications under this Act

THE DENTAL BOARD

The Dental Board of the United Kingdom was established for the purpose of administering the new Act The first members of the Board, who held office for three years, were all appointed, but their term has now come to an end The Board consists of the chairman, appointed by the Privy Council, three members appointed by the General Medical Council, who must be members of the Branch Councils for England, Scotland, and Ireland, respectively, three persons who are neither medical practitioners nor dentists, appointed to represent England, Scotland, and Ireland, and six elected members, one of whom represents the qualified dentists in England and Wales, one those in Scotland, and one those in Northern Ireland, and two all the dentists registered under the Acts of 1921 and 1923

On the establishment of the Dental Board in 1921 certain powers and duties of the General Medical Council were transferred to it, including the duty of erasing from the *Dentists Register* any entry which has been incorrectly or fraudulently made An inquiry into the case of a person alleged to be liable to have his name erased from the *Register* will be made by the Board, which will report its findings to the General Medical Council, the order directing the erasure being made, as at present, by the Council A name erased from the *Register* can only be restored by the Council upon a report made by the Board An appeal to the High Court may be made by any person aggrieved either by refusal of the Board to register his name or by the removal of his name from the *Register* The administrative expenses of the Board are defrayed from the registration fees and annual retention fees, but any surplus may be allocated to purposes connected with dental education and research or to any public purpose connected with dentistry The office of the Dental Board is at 44, Hallam Street, London, W 1

The *Dentists Register* for 1924 contains the names of 13,473 persons, of whom less than a half are registered with qualifications, 8,136 names having been registered under the Dentists Acts, 1921 and 1923

DENTAL EDUCATION AND EXAMINATION

The preliminary examination in Arts is the same for medical and dental students, and the early stages of their education embrace much the same subjects[1], and, as the dental student is required to obtain a knowledge of the broad principles of medicine and surgery, it is necessary for him to pursue some portion of his studies at a medical school as well as at a special dental school, the latter not undertaking the teaching of these subjects Registration as a dental student is not in all cases compulsory, though it is to be advised as convenient as affording proof of the commencement of professional education and it is required by most of the licensing bodies, all of whom insist upon a curriculum covering four academic years

Qualifying licences are granted by the Royal Colleges of Surgeons of England and of Edinburgh and of Ireland by the Royal Faculty of Physicians and Surgeons, Glasgow, and by certain of the universities in the United Kingdom

Recognized dental schools are numerous In London there are those connected with the Royal Dental Hospital, Leicester Square,

[1] See the Registrar's Memorandum, printed in the article on this General Medical Council at page 504

the National Dental Hospital (now the University College Hospital Dental School), Great Portland Street, Guy's Hospital; and the London Hospital In the provinces there are the Birmingham Dental Hospital the Royal Infirmary and the General Hospital Bristol, the Dental Hospital and the Public Dispensary, Leeds, the Dental Hospital, Liverpool the Dental Hospital, Manchester the Dental Hospital and School, Newcastle upon Tyne the Royal Hospital, Sheffield. In Scotland there are the Dental Hospital, Dundee, the Incorporated Dental Hospital and School, Edinburgh and the Incorporated Dental Hospital, Glasgow, and in Ireland the Incorporated Dental Hospital of Ireland and the Royal College of Surgeons in Ireland.

Study may also be commenced in the dental department of any university of the United Kingdom The universities mentioned in the current issue of the *Medical Directory* as possessing dental schools or departments are: Birmingham, Leeds, Liverpool, Manchester and Sheffield.

There are considerable variations in the order in which the different licensing bodies require the various subjects of the curriculum to be taken up, and every prospective dental student should study, not only the regulations of the General Medical Council, but also those of the body whose licence he hopes to obtain This is the more important as in the case of some licensing bodies changes in the curriculum, with the view of making it more closely adapted to the needs of the practising dentist, have either already been made or are in contemplation

Recommendations of the General Medical Council

The Dentists Act still leaves to the General Medical Council the duty of controlling the course of study and examinations required for dental qualifications

The following recommendations as to the course of study and examinations to be required of candidates for degrees or licences in dentistry or dental surgery were adopted by the Council on May 27th, 1922

Preliminary Examination and Registration

1 That every dental student shall at the commencement of his studentship be registered in the manner and under the conditions prescribed for medical students

2. That before registration in the *Dental Students Register* every applicant shall be required to have passed in addition to the examination in general education, which shall be the same as that required for medical students an examination in Elementary Physics and Elementary Chemistry conducted or recognized by one of the licensing bodies, which shall also be the same as that required for medical students

3 That before registration as a dental student every applicant shall produce evidence that he has attained the age of 17 years

Professional Study

4 That every candidate for a degree or licence in dentistry or dental surgery shall be required before admission to the final or qualifying examination to produce certificates showing

(i) That he is at least 21 years of age

(ii) That he has been registered as a dental student

(iii) That he has, subsequently to the date of registration as a dental student, been engaged in professional study for at least four years, of which three years at least shall be spent at a school or schools recognized for professional study by one of the licensing bodies

(iv) That, subsequently to the date of registration as a dental student he has attended at a recognized medical school courses of instruction which shall be the same as those required for medical students in the following subjects (*a*) Chemistry, and (*b*) Physics in their application to Medicine, (*c*) Elementary Biology That he has attended at a recognized medical school courses of instruction in the following subjects (*d*) Human Anatomy (with dissections and demonstrations) for three academic terms (*e*) Physiology (with laboratory instruction, including Practical Histology) for two academic terms (*f*) General Pathology (including Bacteriology) for two academic terms (*g*) Medicine for two academic terms (*h*) Surgery for two academic terms (*i*) the practice of a recognized general hospital or hospitals of not less than eighty beds with certified instruction in Clinical Medicine and Clinical Surgery for four academic terms

(v) That he has attended at a recognized dental school courses of instruction in the following special subjects (*a*) Dental Anatomy and Physiology human and comparative The course should comprise a minimum of twenty meetings of the class (*b*) Practical Dental Histology and Morbid Histology The course should comprise a minimum of sixteen meetings of the class (*c*) Dental Pathology and Surgery The course should comprise a minimum of twenty meetings of the class (*d*) Dental Materia Medica and Therapeutics The course should comprise a minimum of sixteen meetings of the class (*e*) Dental Metallurgy (with practical work and demonstration) The course should comprise a minimum of twenty meetings of the class (*f*) Dental Mechanics (with practical work and demonstrations) The course should comprise a minimum of twenty meetings and twenty demonstrations) (*g*) A course of instruction in the use of Anaesthetics general and local employed in Dental Practice (*h*) A course of instruction in Radiology as applied to Dentistry

(vi) That he has for at least twenty four calendar months attended, during the ordinary academic term, the practice of a recognized dental hospital or of the recognized dental department of a general hospital

(vii) That he has received for not less than twenty four calendar months, or for 2 000 hours practical instruction in dental mechanics

Professional Examinations

5 That the examination for a degree or licence in dentistry or dental surgery shall be partly written partly oral and partly practical and shall include the following subjects (*a*) Chemistry Physics and Biology, in their bearing on Medicine and Dentistry (*b*) Human Anatomy and Physiology (*c*) General Pathology including Bacteriology (*d*) Medicine and Surgery (*e*) Dental Anatomy and Physiology, Dental Pathology Dental Surgery (including Orthodontics) Dental Materia Medica and Therapeutics and Dental Mechanics and Dental Metallurgy (*f*) Practical Examination in Dental Surgery (*g*) Practical Examination in Dental Mechanics and Metallurgy (*h*) Anaesthetics, general and local employed in Dental Practice

6 That the prescribed subjects of examination may be combined or distributed at the discretion of the licensing bodies and may be taken at two or more successive stages during the course of professional study, provided that no candidate shall be admitted to any final examination in Dental Surgery and Dental Mechanics until he shall have completed the required four years course of study

SMITH.—On August 4th at Watford Herts Major F Clarence Smith M.B B.S F.R.C.S I.M.S (ret) eldest son of the late Rev Dr Francis Smith M.A Cantab M.D of Eastbourne Devon of heart failure

[*The present issue being the Annual Educational Number, all current material is held over and neither the Supplement nor the Epitome of Current Medical Literature is published this week*]

The British Medical Association:

ITS AIMS, WORK, AND CONSTITUTION

THE British Medical Association (as briefly stated at the close of our introductory article on the Profession of Medicine) was founded in 1832 to promote the medical and allied sciences, to maintain the honour and interests of the profession, and to foster a feeling of friendship among its members To attain these objects it holds periodical meetings for the discussion both of medical and scientific subjects, and of professional affairs, it publishes the *British Medical Journal*, it maintains a reference and lending library, it has instituted lectures, scholarships, and grants for research It thus concerns itself with every side of medical work—science, clinical medicine, public health, and the material interests of professional life The British Medical Association, with a membership now of more than 28,000, is the oldest, largest, and most powerful British organization devoted to the welfare of the medical profession It has recently acquired a fine building in Tavistock Square, London, for its headquarters, providing ample accommodation for immediate needs and space for future developments, these new premises, designed by Sir Edwin Lutyens, R A , will, it is expected, be ready for occupation next year The remarkable growth in the central work of the Association during recent years has far outstripped the capacity of the present premises at 429, Strand

THE FUTURE HOUSE OF THE BRITISH MEDICAL ASSOCIATION TAVISTOCK SQUARE, LONDON.

Constitution and Administration

The Association has Branches and Divisions throughout Great Britain and Ireland, and also in the Dominions, Colonies, and Dependencies The Divisions are arranged territorially, and number, in all, 281 For certain purposes of administration or of scientific and clinical work, the Divisions are combined into 95 Branches Members of Divisions elect Representatives on the Branch Councils and also a member or members of the Representative Body, which is the governing body of the Association and determines its policy

The Council is the executive of the Association It is elected partly by the Divisions and Branches and partly by the Representative Body, and includes representatives of the Navy, Air Force, Army, and Indian Medical Services elected by the Representative Body The Representative Body and Council elect standing Committees to take charge of different subjects Among these may be mentioned the Science, Medico-Political, Ethical, Hospitals, Public Health, and Naval and Military Committees There are Committees also for the Dominions, Scotland, Ireland, and Wales, and for the working machinery of the Association, such as the Organization, Finance, and Journal Committees The Insurance Acts Committee, elected partly by the Association and partly by insurance medical practitioners, is financed by the Association, it is the recognized executive and mouthpiece of the insurance practitioners of Great Britain

Privileges of Members

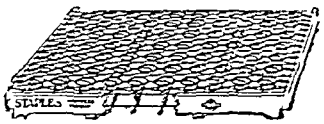
A member of the British Medical Association has the right—

1 To attend the annual and other general meetings of the Association and the meetings of the Division and Branch to which he or she belongs

2 To take part by personal vote (or in some Divisions by voting paper) in the election of the representative of his or her Division in the Representative Body, and also in the election of members of the Council

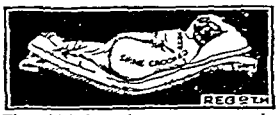
3 To receive by post the *British Medical Journal*, published weekly, which gives a full record, with commentary, of progress in clinical and scientific medicine, and of medico-political affairs throughout the British Empire

4 To receive the help and advice of the central office in any professional difficulty



5 To use the library as a reading room, and to borrow current medical or scientific books on payment of postage Besides modern works and periodical medical literature—foreign as well as English—the library contains many books of historic interest

The full benefits of the Association can only be secured by the co-operation of large numbers of the medical profession, who by their annual subscriptions provide the necessary funds The greater the membership and the funds the more efficient and influential the organization The Association during the past ninety-two years has been the direct means of benefiting every class of medical men and medical women In asking for new members it looks not only to the older practitioners but also and especially to those recently qualified To these a generous concession is made as regards subscription, and there is a special claim to their recognition of the work of the British Medical Association in improving the conditions under which they may hold appointments in the public services or in civil life The *Association's work for* the services is well known It considers itself to be in a special sense the guardian of the interests of those members of the profession who by reason of their position are precluded from taking common action At the present time, when nearly all the Imperial services are being cut down both in numbers and in remuneration, it is ordinary prudence for every medical officer to join his professional organization



Subscriptions and Applications for Membership

The ordinary subscription to the British Medical Association is 3 guineas a year for members resident in the United Kingdom, but this is subject to various exceptions Thus, newly qualified practitioners elected within two years of registration pay half this sum up to the end of the fourth year after registration, medical officers on the active list of the R N , R A F , R A M C (Regular), and I M S pay 2 guineas, concessions are made also to members (in the British Isles) of forty years' standing, to members of ten years' standing who have retired from practice, to medical married couples residing together, and to whole time teachers and research workers The ordinary subscription for members living abroad is 1½ guineas, but some Branches have special local subscriptions A member elected after June 30th in any year pays for that year one half the current annual subscription

All duly qualified British medical practitioners are eligible for election as members Full particulars can be obtained on application to the Medical Secretary, British Medical Association, 429, Strand, London, W C 2, the Scottish Medical Secretary, 19, Rutland Square, Edinburgh, or the Irish Medical Secretary, 16, South Frederick Street, Dublin

Monday at 4 30 May to July

The WINTER SESSION commences OCTOBER 1st, 1924.

This Hospital and School, situated in the centre of a large population, and within a few minutes of *University College* Hospital, has recently been reorganised and equipped on the highest standard of modern requirements, and is admirably adapted for the teaching of students in every branch of the Science and Art of Dental Surgery

The mechanical laboratory, conservation room, and X-rays department are replete with all the latest approved appliances

Students (men and women) enter as students of University College Hospital, and attend classes in anatomy and physiology at *University College*, adjacent to *University College* Hospital

Each student serves as a dresser in the extraction, anæsthetic, conservation, and X-rays departments

Four house surgeons are appointed half yearly

The calendar, containing full information as to lectures, fees, prizes, &c, may be had on application to the Sub Dean or Dental Students, who attends the hospital on Monday mornings, at 10 a m

KING'S COLLEGE HOSPITAL MEDICAL SCHOOL

(UNIVERSITY OF LONDON).

The HOSPITAL was opened in 1913 and is the most modern and one of the best equipped Hospitals in England The importance of specialisation has long been recognised by the Hospital, and it has now sixteen Special Departments, each in charge of a specialist and his staff It was planned for 600 beds, but at present, owing to lack of funds, 200 are not yet available It serves a population of nearly 2,000,000, and the attendances in the Casualty and Out patient Departments during the year 1923 amounted to 208,955

The MEDICAL SCHOOL Buildings, like those of the Hospital, are up to date and exceptionally fine The Laboratory and Pathological Department and the Post mortem Room are especially noteworthy Students of both sexes are admitted

In the Education at the Hospital a special feature has always been the individual attention given to each Student, and each subject is taught by its own specialist There is ample opportunity for any Student who wishes to specialise in a subject to continue his studies with the help of Junior Staff Appointments With a view to ensuring better co ordination of studies, the teaching of each of the subjects of Medicine, Surgery, and Gynæcology has been placed in charge of a member of the Senior Honorary Staff, assisted by Medical, Surgical, Obstetric, and Pathological Tutors Attached to the Gynæcological Department is a Maternity Ward, through which Students can qualify for the requirements in that subject of all the Examining Bodies There is a *Special Course in Radiology for Students working for the Cambridge* Diploma in Medical Radiology and Electrology

The Regius Professors of Oxford and Cambridge nominate yearly to a BURNEY YEO SCHOLARSHIP of £80 from the Students of their respective Universities who have passed the M B Examination in Anatomy and Physiology

SCHOLARSHIPS in ANATOMY and PHYSIOLOGY, and in PATHOLOGY and PHARMACOLOGY, value £50 each, confined to University Students, are also awarded yearly in September

DENTAL SCHOOL When the Hospital was built accommodation was provided for a Dental Department Arrangements have been made for the use of this section, together with additional rooms for Dental Metallurgy, by the Dental School, which was opened in October, 1923, under the direction of Mr A LIVINGSTON, M B, Ch B, Mast Dent Surg

A full course is given in co operation with King's College, and includes arrangements for students who desire to avail themselves of the special provisions of the Dentists' Act

"The PLANTANES," close to the Hospital, with large grounds and tennis courts, is available as a residence for Students

The ATHLETIC GROUND (over six acres in extent) is within ten minutes' walk of the Hospital

The Fee for the advanced studies is 93 guineas The Entrance Fee of 10 guineas includes membership of the Clubs and Societies Union

For Particulars, Calendar of the School, and Appointments to see the School and Hospital, application should be made to the Dean, H WILLOUGHBY LYLE, M D, B S Lond, F R C S, or to the Secretary, S. C RANGER, M A Cantab, King's College Hospital Medical School, Denmark Hill, London, S E 5

THE WINTER SESSION will commence on the 1st October, 1924

THE SCHOOL IS FOR FINAL STUDIES only

STUDENTS are prepared for the degrees of the Universities of —
OXFORD, CAMBRIDGE, LONDON, and DURHAM, and for the Diplomas of other qualifying bodies.

CLINICAL UNITS in MEDICINE and SURGERY are now in operation—The whole time Directors of the Units are concerned with the organization of the teaching generally, but the honorary staff are responsible for the largest share of the teaching in the wards and Out Patient Department of the Hospital. A Unit in Obstetric Medicine will be established as soon as the new Obstetric Hospital, now in course of construction, is finished.

Director of Medical Unit—Prof T P ELLIOTT F R S
Director of Surgical Unit—Prof C C CHOYCE
Assistants—Dr J W McNEE Dr H K HETZEL, Dr F B VERNEY and Dr P HILTON
Assistants—Mr JULIAN TAYLOR and Mr F J F BARLLIGTON

DENTAL STUDENTS can obtain a complete curriculum at University College, and at University College Hospital Dental School (The National Dental Hospital, Great Portland Street). This Hospital has recently been re-organized and equipped on the highest standard of modern requirements, and is admirably adapted for the teaching of Students in every branch of the science and art of Dental Surgery.

FEES—For the Final Course 112 guineas if paid in one sum, or 115 guineas paid in two instalments of 70 and 45 guineas.

APPOINTMENTS—Forty seven appointments are open during the year to students, and paid appointments to the annual value of over £2000.

SCHOLARSHIPS, EXHIBITIONS, and Prizes, of the value of over £1,000, are awarded annually. Among the most important are —

GRAHAM SCHOLARSHIP in Pathology, £300 per annum.
LESLIE PEARCE GOULD SCHOLARSHIP, awarded every two years, about £200
RADCLIFFE CROCKER TRAVELLING SCHOLARSHIP in Dermatology, awarded every five years, about £250
MAGRATH SCHOLARSHIP in Clinical Medicine, about £100
PERCIVAL ALLEYN PRIZE, about £60
ATCHISON SCHOLARSHIP, about £55 per annum, tenable for two years.
ATKINSON MORLEY SCHOLARSHIP, £45 per annum, tenable for three years.
BUCKNILL SCHOLARSHIP, entitles the holder to the Intermediate Medical Course at University College, and of the Final Course at the Medical School.
GOLDSMID EXHIBITIONS. Two Exhibitions, the subjects of the Examination being Anatomy and Physiology, are awarded annually in July and entitled to count for Final Medical Examination.

All further information and Prospectuses can be obtained from the Secretary, and the Dean can be interviewed at any time by appointment.

Dean—SIR GEORGE BLACKER, C B E. M D F R C P, F R C S.
Vice Dean—GWYNNE WILLIAMS, M.S., F.R.C.S.
Secretary—G E ADAMS, F C I S

Westminster Hospital Medical School.

Telephone No, Victoria 765

UNIVERSITY OF LONDON.

The Hospital is situated opposite Westminster Abbey and the Medical School is only a few minutes' walk from it

The entire teaching of the Hospital and School is devoted to the subjects of the Final Examinations Arrangements are made for the tuition required for Preliminary and Intermediate subjects

The School and Hospital Appointments are open on the same terms and conditions to Men and Women Students

Entrance Scholarships.

Two of £70 each in Anatomy and Physiology in April of each year Open
Two of £70 each in Anatomy and Physiology in September of each year Open

Valuable prizes are offered in addition to Students during their period of Clinical Study Paid appointments as House Physicians, House Surgeons, and Registrars are held by Students when they have passed their final examination

Fees.—Annual Composition fee 35 guineas

The Fees include membership to the Sports Union Club with its various branches, Football, Cricket, Tennis, Boxing, Guthrie Society and Broadway Gazette

For information on all matters relating to the Medical School, Prizes, Scholarships, &c, application should be made to the Medical Secretary at the School, Caxton Street, Westminster, S W 1

The Dean will be glad to have a personal interview with Parents or Guardians of intending Students by appointment

A certain number of Scholarships have been allotted to Universities of England, Wales, and the Colonies, and to Public Shcools These Scholarships are awarded entirely on the nomination of the Principal of the University or School, any Principal of a University or Headmaster of a School who wishes to avail himself of this opportunity is asked to communicate with the Dean

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL

(UNIVERSITY OF LONDON).

HYDE PARK CORNER, S.W.

THE HOSPITAL and MEDICAL SCHOOL occupy the finest site in London, and are readily accessible from all parts of the Metropolis

The entire teaching in the School is devoted to the subjects of the Final Examinations, in other words, **is specially adapted to the interests of men from the Universities who have passed their Examination in Anatomy and Physiology.**

By arrangement with the authorities of King's College in the Strand, St George's students attend at that College for tuition in the Preliminary and Intermediate subjects

FIVE ENTRANCE SCHOLARSHIPS IN ANATOMY AND PHYSIOLOGY, of the value of £120, £94 10s, £80, £70 and £50 respectively, are awarded in July to candidates who have passed the **2nd M B** or corresponding examination In addition, **EXHIBITIONS,** each of the value of £40 and up to **Eight in number,** will be awarded to candidates of approved merit in the Entrance Scholarship Examination

MANY VALUABLE PRIZES ARE AWARDED EACH YEAR, including the following —Allingham Scholarship of the value of £80, Laking Memorial Prize of the value of £65, the Brackenbury Prize in Medicine, the Brackenbury Prize in Surgery and the Webb Prize in Bacteriology, each of the value of £33

HOUSE OFFICE may be held for six, twelve or eighteen months **A Student of ordinary ability should be certain of obtaining House Office and afterwards one of the following Paid Appointments for a short time** Resident Assistant Physician, £350, Resident Assistant Surgeon, £350, Medical Registrar, £200, Surgical Registrar, £200, Assistant Curator of the Museum £100, Resident Anæsthetist, £100, Resident Obstetric Assistant, £50

The **ST GEORGE'S HOSPITAL CLUB** incorporates the **RUGBY FOOTBALL, CRICKET, LAWN TENNIS, BOXING, RIFLE** and other Clubs, and possesses an **ATHLETIC GROUND** within easy reach of the Hospital, and Smoking and Luncheon Rooms on the School premises

Entrance Fee £10 10s 0d Annual Composition Fee, which covers all courses, lectures, etc, in the Hospital and School, £12 Annual Club Subscription, £3 3s 0d

The Winter Session will begin on October 1st, but students can enter at any time

Further information may be obtained from the Dean of the Medical School

J A TORRENS, M D, F R C P
Dean

MIDDLESEX HOSPITAL MEDICAL SCHOOL

University of London.

ENTRANCE SCHOLARSHIP EXAMINATIONS BEGIN SEPTEMBER 15th

The entire Medical Curriculum can be taken at this School There is no accommodation for Women Students Annual value of Scholarships and Prizes £1,000 Large Research Funds

Staff includes 6 University Professors, 1 University Reader, 29 Lecturers, 8 Demonstrators and 4 Tutors

ENTIRE CURRICULUM—The provision whereby ALL THE SUBJECTS OF THE CURRICULUM, INCLUDING CHEMISTRY AND PHYSICS FOR THE PRE MEDICAL EXAMINATION, are taught WITHIN THE PRECINCTS OF THE HOSPITAL AND MEDICAL SCHOOL, and every effort made to encourage co ordination ensures that the student instead of proceeding to the study of the various subjects as if they were isolated and having little or no relation to each other, is taught each subject by Professors and Lecturers, who are instructing medical students only, and are in close touch with all the other departments of the school Under this arrangement not only have students of the Middlesex Hospital obtained the highest honours in examinations, but they have also been admirably equipped to practice their profession and to take the fullest advantage of any new knowledge which research may bring to light The following description of the work of the various departments will show the way in which this co-ordination is carried out Its value to the student and to medicine is obvious, for the teaching of the elementary subjects is closely connected with that of the clinical subjects with which they are related

CHEMISTRY is taught by Professor W B Tuck and the class room and laboratories are in the immediate vicinity of those for anatomy physiology pharmacology pathology and bacteriology This leads to a close association with these departments and the student realizes he is not learning just the chemistry which he requires for his first professional examination but is acquiring knowledge which he will need and have to apply in later years Professor Tuck also gives instructions in Toxicology and in the chemistry required by candidates for the DIPLOMAS IN PUBLIC HEALTH so keeps in touch with students in their final years, and also in their post-graduate studies

THE PHYSICS DEPARTMENT is under the charge of Professor Sidney Russ who is also Physicist to the Hospital and engaged in research work on the measurements and dosage of X ray and Radium emanations He is therefore in close touch with the departments of physiology and pathology, and takes an active part in departments for clinical therapeutics Under his direction the student will realize at once that he is not studying an isolated subject for the purpose of training his mind or simply to comply with regulations and pass an examination but is in touch with a subject which will be of great and increasing importance in the proper understanding of his work in later years

BIOLOGY—The Lecturer on Biology is Mr J H Woodger, who holds a University Readership in this subject His teaching in Biology is characterised by co ordination with other departments and the bearing of the subject on the later stages of the curriculum is emphasized Not only is the subject taught as an introduction to the study of Anatomy and Physiology, but the increasing importance of a knowledge of the lower forms of vegetable life and of the protozoa in the causation of disease and the study of insect carriers of human diseases is emphasized by co-ordination with the Pathological Institute

IN THE DEPARTMENT OF ANATOMY, under the direction of Professor Thomas Yeates with the general scientific study of Anatomy and its wider Biological aspects the relation of structure to function and pathology is not lost sight of Facts of clinical medicine and surgery of pathology biology and physiology are included in the teaching in order to emphasize the significance of anatomical points By classes in Applied Medical and Surgical Anatomy the study of this subject is continued in the later stages of the student's career

THE TEACHING OF PHYSIOLOGY is in the hands of Professor Swale Vincent and the department is in close touch with those for the teaching of both the preliminary and final subjects of the curriculum It is impressed upon the student in this department that he cannot be a good clinician unless he obtains a sound knowledge of Physiology Later in his career the student has continuous opportunities of applying what he has learnt in the physiological department and his physiological knowledge is further extended notably in the study of PHARMACOLOGY and in the CARDIOGRAPHIC DEPARTMENT where he has opportunities of studying the electrical conditions of the heart both in health and disease

IN THE BLAND-SUTTON INSTITUTE OF PATHOLOGY, all the departments of the Medical School are brought in touch Here the student learns the SCIENCE OF DISEASE The teaching of Pathology is in the hands of Professor J McIntosh, and under his tuition the student is made to realize that Pathology and Medicine are one and that a clear knowledge of Pathology and Bacteriology is essential for the prevention, diagnosis and treatment of disease The teaching of pathology is brought into the closest touch with clinical teaching and the student sees the practical application of the sciences in which he has been instructed in the earlier years of the curriculum—chemistry, physics biology anatomy, and physiology

Special attention is given to the teaching of BIO CHEMISTRY which is under the direction of Dr E C Dodds

CLINICAL TEACHING is carried out in the general wards and out patients departments and in the special departments all of which are in close touch with the scientific departments in the School The student has ample opportunities for carrying out the physical examination of patients and with his training on the scientific side combines instruction in the Art of Medicine by constantly being brought in contact with patients and being made to realize the human side of his professional work In order that the student may have ample bedside teaching and opportunities for carrying out the examination of patients himself the number of students allowed at a Clinique is limited

There are ample clinical appointments for all students and Twenty five Resident appointments are open annually to students of the School who have obtained their degrees or diplomas

THE SOCIAL AND ATHLETIC side of the student's life has been arranged for There are large athletic grounds with new Pavilion restaurant and gymnasium Common Room Society Medical Society, Musical Society and various other Clubs

Write for prospectus to the DEAN, A E Webb Johnson, C B E, D S O, F P C S, F A C S, Middlesex Hospital Medical School, Berners Street London W 1

Charing Cross Hospital Medical School

(UNIVERSITY OF LONDON)

with which is affiliated **THE ROYAL WESTMINSTER OPHTHALMIC HOSPITAL** (adjoining)

OPEN to MEN and WOMEN Students. WINTER SESSION commences on WEDNESDAY, OCTOBER 1st.

The **most central** of all the **Colleges** of the **University**

Complete Hospital and School arrangements for all departments of Clinical Work

The Institute of Pathology includes a series of Laboratories fully equipped for student post-graduate, and research work

Students' Club Rooms and **Restaurant** on the School premises

A new Athletic Ground (6½ acres) has recently been acquired at Listcote and is now in use

Four Scholarships each of the value of 40 guineas per annum and tenable for three years are awarded annually to students who have completed the Second Medical Examination of the University of London or Cambridge held in July each year

FEES LOW and INCLUSIVE, NO EXTRAS

For prospectus and full information apply personally or by letter to the Dean W. J. PLATON, M.D., I.R.C.P.

Telephone No. Regent 2208 Charing Cross Hospital Medical School, London, W.C.2

UNIVERSITY OF BRISTOL.

FACULTY OF MEDICINE.

The AUTUMN TERM commences on October 1st, 1924.

The University grants the degrees of Bachelor of Medicine and Surgery (M.B., Ch.B.), Master of Surgery (Ch.M.), Doctor of Medicine (M.D.), Bachelor of Dental Surgery (B.D.S.), and Master of Dental Surgery (M.D.S.), as well as diplomas in Public Health (D.P.H.) and Dental Surgery (L.D.S.).

The lectures and laboratory courses which are given in the University, although primarily designed for the degrees and diplomas of the University, are equally adapted to those of other Universities and Examining Boards, and students preparing for such external degrees and diplomas have equal attention paid to them.

Hospital Practice and Clinical Instruction are provided in the Hospitals and Asylum of the City, associated with the University for this purpose, and students have exceptional opportunities of studying the practice of Medicine from a large variety of cases.

Women are admitted to all classes, lectures and laboratory practice, and attend them with men. The Halls of Residence for Men and for Women Students are situated in Clifton, near the University.

INCLUSIVE FEES—

For the M.B., Ch.B. curriculum (paid in Annual Instalments)	205 guineas
For the B.D.S. curriculum, including Mechanical Laboratory	215 "
Do. excluding Mechanical Laboratory	155 "
For the L.D.S. curriculum, including Mechanical Laboratory	200 "
Do. excluding Mechanical Laboratory	140 "
For Mechanical Laboratory alone	60 "

For additional particulars apply to Professor EDWARD FAWCETT, M.D., F.R.S., Dean.

ROYAL WESTMINSTER OPHTHALMIC HOSPITAL,

KING WILLIAM STREET, STRAND, W.C.2.

(Next door to Charing Cross Hospital)

The Practice at this Hospital is open to all Qualified Medical Men and Women and to Registered Medical Students.

The posts of Clinical Assistant and Refraction Assistant (paid) are open on conditions to be obtained on application to the Dean.

Clinical Instruction is given daily in the Outpatients Department from 1 p.m. Operations are performed daily in the Theatre at 3 p.m.

Classes in all subjects of Ophthalmology are held during each Winter and Summer Session. Next Classes commence on MONDAY OCTOBER 6TH. (These Classes are arranged to meet requirements of D.O.M.S. Eng., Part II.).

For full particulars apply to the DEAN or SECRETARY at the Hospital.

MASSAGE AND MEDICAL ELECTRICITY.

Association of Certificated Blind Masseurs.

President: Sir ROBERT JONES, K.B.E., C.B.

Fully qualified Blind MASSEURS and MASSEUSES can be obtained in London and the Provinces, on application to — THE SECRETARY, 224 Great Portland Street, London, W.1. Telephone LANGHAM 2544.

UNIVERSITY OF DUBLIN

SCHOOL OF PHYSIC.

TRINITY COLLEGE.

The WINTER SESSION will begin on October 1st, 1924.

All information regarding Courses for the Medical and Dental Degrees, for the Diploma in Public Health, and for the Diploma in Gynæcology and Obstetrics may be obtained on application to the REGISTRAR, School of Physic, Trinity College, Dublin.

THE ROYAL DENTAL HOSPITAL OF LONDON

SCHOOL OF DENTAL SURGERY.

(University of London) Leicester Square W.C.2

WINTER SESSION 1924 commences Oct. 1st.

The SCHOOL and CLINIC of the Hospital.

The classes are open to the public.

PRELIMINARY SCIENCE AND PRE-MEDICAL EXAMINATION

These Classes are held during the Winter and Summer Sessions and are open to students who have not yet commenced their Professional study.

DENTAL MECHANICS

The Laboratories occupy an entire floor of the building.

PUPILS may JOIN at the commencement of either the OCTOBER or MAY Sessions for the two years training in Dental Mechanics specified in the Curriculum.

WOMEN are now admitted as Students of the School and are eligible for all appointments and prizes.

Write for further particulars and School Calendar.

THE DEAN as above.

THE UNIVERSITY OF LEEDS

FACULTY OF MEDICINE

SCHOOL of MEDICINE and THE GENERAL INFIRMARY at LEEDS

The First Term begins on OCTOBER 1ST, 1924

The degrees of M B , Ch B , Ch M and M D are conferred, and diplomas in Public Health and Psychological Medicine are granted by the University

The systematic Classes and Lectures are held in the School of Medicine of the University, while the Clinical instruction is given in the General Infirmary The combined courses of study are arranged to meet the University Regulations in the first instance, but they also afford every opportunity for students preparing for the examinations of any licensing body

The instruction in the subjects for the First Examination is given in the Department of Science of the University

The Composition Fee for the Academic Courses and Clinical instruction (excluding the first year) is £174

For further particulars application should be made —

Regarding instruction given at the University to
THE ACADEMIC SUB-DEAN,
School of Medicine,
Leeds

Regarding instruction given at the Infirmary to
THE CLINICAL SUB-DEAN,
General Infirmary,
Leeds.

THE UNIVERSITY OF LEEDS

SCHOOL OF DENTISTRY

The First Term begins on OCTOBER 1ST, 1924

The degrees of B Ch D and M Ch D , as well as a diploma, L D S , are conferred by the University

The systematic Classes and Lectures are held in the School of Medicine of the University, while the clinical instruction is given in the Leeds General Infirmary The combined courses of study are arranged to meet the University Regulations in the first instance, but they also afford every opportunity for study to students preparing for any of the dental examinations

Intending students can enter as pupils in the Dental School and can obtain instruction in the preliminary scientific subjects in the Department of Science of the University

For further particulars application should be made —

Regarding instructions given at the University to
The ACADEMIC SUB DEAN,
School of Medicine,
Leeds

Regarding Clinical instruction
THE WARDEN,
Dental Department,
School of Dentistry Leeds

THE UNIVERSITY OF LIVERPOOL.

FACULTY OF MEDICINE.

THE MEDICAL SCHOOL provides complete courses of instruction for the Examinations of the University of Liverpool, and also meets the requirements of other Universities and Examining Bodies in the United Kingdom

Other Schools of the Faculty are —The School of Dental Surgery, the School of Hygiene, the School of Tropical Medicine and the School of Veterinary Science

DEGREES AND DIPLOMAS IN THE FACULTY OF MEDICINE.

Bachelor of Medicine & Bachelor of Surgery	M B, Ch B	Master of Veterinary Science	M V Sc
Doctor of Medicine	M D	Doctor of Veterinary Science	D V Sc
Master of Surgery	Ch M	Doctorate in Philosophy	Ph D
Master of Hygiene	M H	Licence in Dental Surgery	L D S
Master of Orthopædic Surgery	M Ch Orth	Diploma in Public Health	D P H
Bachelor of Dental Surgery	B D S	Diploma in Tropical Medicine	D T M
Master of Dental Surgery	M D S	Diploma in Veterinary Hygiene	D V H
Bachelor of Veterinary Science	B V Sc	Diploma in Medical Radiology & Electrology	D M R E

Valuable Fellowships, Scholarships, and Prizes are offered for competition each year

THE CLINICAL SCHOOL consists of FOUR GENERAL HOSPITALS The Royal Infirmary, the Royal Southern Hospital, the David Lewis Northern Hospital, and the Stanley Hospital, and of SIX SPECIAL HOSPITALS The Eye and Ear Infirmary, the Hospital for Women, the Royal Liverpool Children's Hospital, the Liverpool Maternity Hospital and Ladies' Charity, St Paul's Eye and Ear Hospital, and St George's Hospital for Skin Diseases

These Hospitals contain in all about 1,134 Beds

The organization of these Hospitals to form one teaching Institution provides the Medical Student and Medical Practitioner with a field for clinical education and study which is unrivalled in extent in the United Kingdom

Infectious Diseases are studied in the City Hospitals, and Mental Diseases at the County Mental Hospital, Rainhill

For information on all matters concerning the curriculum application should be made to the Dean of the Faculty of Medicine, the University, Liverpool

W J DILLING, *Dean*

THE CLINICAL SCHOOL,

UNIVERSITY OF LIVERPOOL.

The following Hospitals are associated for purposes of Clinical Instruction, and form the Clinical School of the University —

THE ROYAL INFIRMARY	THE EYE AND EAR INFIRMARY	THE HOSPITAL FOR WOMEN
THE ROYAL SOUTHERN HOSPITAL	THE INFIRMARY FOR CHILDREN	ST PAUL'S EYE HOSPITAL.
THE DAVID LEWIS NORTHERN HOSPITAL.	LIVERPOOL MATERNITY HOSPITAL	ST GEORGE'S HOSPITAL FOR SKIN DISEASES
THE STANLEY HOSPITAL		

The Staffs of these Hospitals form the Teaching Staff of the Clinical School There are 1,187 beds in the Associated Hospitals, affording a field for Clinical Instruction which is unrivalled in the United Kingdom

Twenty one house physicians and house surgeons are appointed every six months in the General Hospitals, and the majority of these receive salaries ranging from £60 to £100 per annum Five resident medical officers are also appointed at intervals to the Special Hospitals

Information regarding the regulations for Hospital Practice may be obtained from the Secretary of the School,

J O MATTHEWS, M A, M D M R C P 61 RODNEY STREET

UNIVERSITY OF BIRMINGHAM

FACULTY OF MEDICINE

(Associated with the General and Queen's Hospitals for Clinical Teaching).

The following Hospitals are also associated with the University The Department for Midwifery and Diseases of Women at the Dudley Road Hospital (Birmingham Board of Guardians) The City Mental Hospital The City Infectious Diseases Hospital The Birmingham and Midland Eye Hospital The Royal Orthopædic and Spinal Hospital Birmingham The Birmingham and Midland Ear and Throat Hospital The Children's Hospital The Maternity Hospital of the Birmingham Lying-in Charity The Birmingham and Midland Hospital for Women

SCHOOL OF DENTISTRY

The Dental Hospital is situated close to the Medical Faculty Buildings of the University and has a large and varied Clinic

THE WINTER SESSION OPENS OCTOBER 6th, 1924

The University grants Degrees in Medicine Surgery, and Public Health and a Diploma in Public Health also Degrees and a Diploma in Dental Surgery The courses of instruction are also adapted to meet the requirements of other Universities and Licensing Bodies

HOSPITAL APPOINTMENTS

A large number of Resident hospital appointments in Birmingham and District are open to qualified students of the school

PRE-MEDICAL COURSES

The necessary pre Medical Courses of instruction in Chemistry Physics and Biology may be attended in the University

RESIDENCE FOR UNDERGRADUATES AND OTHER STUDENTS

There is a Hostel for men students and one for women students A register of approved lodgings is also kept by the Secretary of the University For Prospectus and further information apply to **WILLIAM F HASLAM F R C S, Dean.**

UNIVERSITY OF MANCHESTER.

FACULTY OF MEDICINE.

The WINTER SESSION commences on OCTOBER 2nd.

The Laboratories and Museums afford every facility to Students and Graduates for Practical Instruction, as well as for Original Research

SCOPE OF INSTRUCTION

Complete Courses of Instruction are offered for the Examinations of the University of Manchester and also for the Examinations of other Examining Bodies in the United Kingdom Post Graduate Courses are held in preparation for the Diploma in Psychological Medicine (Manch) and also in preparation for the Diploma in Medical Radiology and Electrology at Cambridge. In the Dental Department Complete Courses are given preparing for the Degrees and Diploma in Dentistry granted by the University as well as for the Diploma of the Royal College of Surgeons of England, and other Dental Diplomas The Public Health Laboratories are situated at a short distance from the University The fullest opportunities are offered to Graduates and others in preparation for the Diplomas in Bacteriology, in Public Health and Veterinary State Medicine, and for Special Certificates in School Hygiene and Factory Hygiene.

OPPORTUNITIES FOR CLINICAL STUDY ROYAL INFIRMARY AND OTHER HOSPITALS

The Clinical Instruction is given in the new Royal Infirmary opened in 1909 on a site near to the Medical School. It is provided with every modern requirement for the treatment of the sick and the investigation of disease Instruction in Special Subjects is given in other Hospitals associated with the University A large number of beds in the General and in the Special Hospitals are available, thus affording unrivalled opportunities for Clinical Study

1	The Manchester Royal Infirmary	663 beds	
2	The St Mary's Hospitals for Women and Children	229 beds	
3	Manchester Children's Hospital	190 beds	
4	Manchester Royal Eye Hospital	136 beds	
5	Manchester Northern Hospital for Women and Children	70 beds	
6	Fever Hospital for Infectious Diseases	600 beds	
7	Special Hospitals for Diseases of the Ear Throat and Chest Skin and the Christie Cancer Hospital	252 beds	
8	Dental Hospital of Manchester		
9	Ancoats Hospital	120 beds	
10	Salford Royal Hospital	260 beds	

HOSPITAL APPOINTMENTS

In consequence of the large number of Hospitals associated with or in the vicinity of the University exceptional opportunities are offered to Graduates to obtain Resident Hospital Appointments

SCHOLARSHIPS, EXHIBITIONS, AND PRIZES

Two Open Entrance Scholarships each of the value of 160 guineas are offered yearly in July In addition, the Dreschfeld Scholarship of £30 per annum and other Entrance Scholarships of the value of £30 to £40 a year for two or three years are also tenable in the Medical Faculty

Fellowships Scholarships &c. are also offered for competition to Students of the Faculty

RESIDENCE FOR UNDERGRADUATES

There are Halls of Residence both for Men and for Women Students A list of registered lodgings can be obtained. Prospectuses will be forwarded on application to the Internal Registrar

Tropical Hygiene—J. B. Young, M.B., D.S. (conjointly with Professor)
Diseases of the Skin—Sir Norman Walker, M.D., Freda Gardiner, M.D.
Clinical Instruction in Infectious Fevers—Alexander James, M.D., Claude B. Ker, M.D.
History of Medicine—J. D. Comrie, M.A., B.Sc., M.D.
Surgical Pathology—J. M. Graham, M.B., Ch.M.
Practical Anæsthetics—J. Stuart Ross, M.B., Ch.B. (Demonstrator.)
Venereal Diseases—David Lees, D.S.O., M.B.
Psychology—James Drever, M.A., B.Sc., D. Phil.

Practical Instruction is afforded under the supervision of the Professors in Laboratories with the necessary apparatus and in Clinical and Practical Classes connected with the above Chairs and opportunities are afforded to student to extend their practical knowledge and engage in original research.

Opportunities for Hospital Practice are afforded in the Royal Infirmary, the Hospital for Sick Children, Maternity Hospital, the City Parish Hospital and the Asylum for the Insane. Upwards of 2,000 beds are available for the Clinical Instruction of Students of the University.

Four Degrees in Medicine and Surgery are conferred by the University of Edinburgh, viz. Bachelor of Medicine (M.B.), Bachelor of Surgery (Ch.B.), Doctor of Medicine (M.D.) and Master of Surgery (Ch.M.).

The minimum Class Fees for M.B. and Ch.B., including Hospital Fees (£12), amount to about £230, and the Matriculation and Examination Fees to £9 7s. An additional Fee of £1 is payable by those who proceed to M.D. and £21 by those who proceed to Ch.M.

The annual value of the Bursaries, Prizes, Scholarships and Fellowships in the Faculty of Medicine amounts to about £3,000, and the Bursaries, &c., tenable by students of Medicine amounts to about £1,200.

[illegible] are given for the Degrees of B.Sc. and D.Sc. in Public Health and for the University Diploma. These Diplomas are open to approved registered practitioners as well as to graduates in, as part in the Courses given under the auspices of the Edinburgh Post-Graduate Courses in Medicine. In the departments of the Faculty of Medicine provision is made for research by students of graduate standing. In the University laboratories facilities will be provided for candidates for the Degree of Ph.D., whose applications to engage in research have been accepted by the Senatus.

A Syllabus and further information as to Matriculation, the Curricula of Study for Degrees, &c., may be obtained from the Dean of the Faculty of Medicine and for Degrees in the Faculties of Arts, Science, Divinity, Law and Music from the Deans of these Faculties or from the Secretary, and full details are given in the University Calendar published by James Thin, 55 South Bridge, Edinburgh. Price, by post 6s.

August 1924. By the authority of the Senatus, WILLIAM WILSON, Secretary.

UNIVERSITY OF ST. ANDREWS.

FACULTY OF MEDICINE.

The SESSION 1924-1925 commences THURSDAY, OCTOBER 2nd, 1924.

The University confers the Degrees of Bachelor of Medicine and Bachelor of Surgery, Doctor of Medicine, and Master of Surgery; a Diploma in Public Health, and a Diploma in Dental Surgery. The whole Curriculum may be taken at Dundee, or the first two years of the Course may be taken in St Andrews and the remaining three years in Dundee. The Medical Buildings and Laboratories both at St. Andrews and Dundee have been recently built and are fully equipped in all departments for teaching and for research.

CLINICAL INSTRUCTION is given at the Dundee Royal Infirmary which has 400 beds, with Special Wards for Maternity Cases, Diseases of Women, Diseases of Children, Diseases of the Eye, Diseases of the Ear, Throat and Nose, Diseases of the Skin, Cancer, and for cases requiring Electrical treatment.

BURSARIES.—At the UNITED COLLEGE, ST ANDREWS, Six Taylour Thomson Entrance Bursaries for Women of the annual value of from £10 to £50 each—tenable for two years—preference to Women Medical Students. One Malcolm Bursary of the value of £25 (tenable by men or women entrants) for five years. Additional Bursaries, six or eight—(for three of which women may compete) ranging, in value from £20 to £15, are open to Entrant Students of Medicine, Arts or Science. Bursaries are competed for annually in June. Schedules of application, subjects of examination, and conditions of tenure may be obtained from the Secretary of the University. The Schedules for the 1925 Competition must be returned before May 12th 1925. Specimen Examination Papers (1/) may be had from the Secretary.

At UNIVERSITY COLLEGE, DUNDEE, twelve Entrance Bursaries of the value of £15 each, and fourteen Second and Third Year's Bursaries of the value of £20 and £15, are open to competition in June. Two Fourth and two Fifth Year's Bursaries of £20 each are open to students who take the Complete Curriculum in Dundee. These are all tenable for one year. Particulars and schedules of application may be obtained from the Secretary of the College. Schedules should be sent in before May 10th 1925. Other Bursaries, of which the patronage is vested in trustees, are available.

FEES.—The Fees for the Complete Course, exclusive of the Examination Fees, amount to £130.

PRELIMINARY EXAMINATION.—The Preliminary Examination in General Education will begin at the United College, St Andrews, on September 5th and on March 6th. Each Candidate must apply to the Secretary of the University for a schedule, to be filled up and returned not later than August 30th or February 16th. The subjects of examination are—English, Latin, Mathematics, Greek, French, German, Dynamics, one of which must be taken under certain restrictions, and the fee is one guinea. Specimen Examination Papers (1/6) may be had from the Secretary or Messrs Henderson, Booksellers, St Andrews.

PRE-REGISTRATION EXAMINATION.—The Pre-Registration Examinations in Physics and Chemistry will take place September 2nd and December 12th, 1924, and on June 10th and 15th, 1925. Schedules to be sent in August 31st, November 15th and May 15th.

Before beginning a course of study for Graduation every student must obtain a certificate showing that he has satisfied the Scottish Universities Entrance Board as to his fitness to enter upon the Curriculum.

For further information apply to the Secretary of the University, St. Andrews, or to Professor CHARTERIS, Dean of the Medical Faculty.

St Andrews University, August, 1924.

Home School for Backward and DELICATE CHILDREN (estab. 1899). Specialists' Patients received. Modern educational methods and handicraft training. Horticulture, garden games and occupations. Entire charge if desired. Elder girls admitted. Terms moderate.—Apply Principal, Hatherley Brake, Cheltenham.

ST MICHAEL'S, BUXTON, BOARDING SCHOOL FOR GIRLS
Graduate Staff. Preparation for University Examinations. Splendid health record. Special attention given to delicate girls. Moderate Fees. Apply Principals.

Small Private Residential SCHOOL, established 1913, for the Physical and Mental Development of ABNORMAL and BACKWARD PUPILS. Special Department. Pupils over school age. Under Medical supervision.—Prospectus Mrs MERRIFIELD, Principal, St Paul's House, Upper Mare Hill, St. Leonards-on-Sea.

INCORPORATED GLASGOW DENTAL HOSPITAL,

158, RENFREW STREET and 15, DALHOUSIE STREET, GLASGOW, C.3.

WINTER SESSION Commences October 7th, 1924.

The School is open to Men and Women Students

Hospital Practice is carried on under the supervision of a large staff of Dental Surgeons and Anæsthetists, who attend daily and give clinical instruction in cases of interest as they occur

Special Demonstrations are given during the Session

Lectures are given on Dental Surgery, Operative Dental Surgery, Orthodontia, Dental Anatomy and Physiology, Pathology, Dental Histology, Radiology, Dental Mechanics, Crown and Bridge work, Dental Metallurgy, Dental Bacteriology, and Anæsthetics

Lectures on general subjects required for Dentistry may be taken at the University, or at one of the extra mural schools, where special provision is made for Dental Students

Fees—Composition fee for two years' Hospital Practice and Lectures special to Dentistry, £50 on entry, or in two instalments of £31 10s and £21, or in three payments of £10 10s, £22 1s and £21

A "Sound" Idea

When a doctor has finished his professional duties for the day he wants all the leisure he can get He doesn t want to be kept busy with accounts For this very reason he should instal Kalamazoo

Kalamazoo is the perfect loose-leaf ledger—and is far and away superior to the old-fashioned bound books, or anything else that has ever been designed for keeping accounts

With Kalamazoo all the "dead" accounts can be removed, whilst the "live" ones can be kept in exact order It eliminates error, affords easy reference, and saves an immense amount of time and work—which is just what he wants

Kalamazoo is made at the famous Kalamazoo factory It is designed by Specialists, manufactured from the best materials, and is neat, strong, light and flexible

A UNIQUE "EVERY CONTINGENCY" INSURANCE

The ideal insurance for professional men is one which covers (1) sickness of all kinds, (2) accidents of all kinds, (3) death, or survival to age 65 The Combined Policy of the Medical Sickness Assurance Society has been specially drawn up to provide for all of these contingencies —the rate charged is the lowest obtainable, the Society deals *only* with medical and dental practitioners, is mutual, and was established in 1884

EXAMPLE:

At age 25 an annual premium of £25 1s 8d. will ensure the following benefits—During incapacity from illness or accident, £7 7s per week for first 26 weeks, and £3 13s 6d per week during remainder of illness to age 65 At age 65 or previous death, £700 Age 30 the premium is £29 0s 5d , 35, £34 3s 1d , 40, £41 4s 10d

The above Policy is entitled to share in bonus on Sickness and Life Assurance

For full particulars write to the Secretary asking for Booklet B 1"

321. SATURDAY, SEPTEMBER 13, 1924. Price 1/3

ESTABLISHED IN 1907

The MEDICAL INSURANCE AGENCY has for its object to ensure that every Medical Man desiring to take out a policy of Assurance or Insurance obtains the particular policy most suited to his needs The M I A has no axe to grind. No policy is recommended unless the security offered is absolute, the terms fair to the assured, and the premium payable is sufficiently low in comparison with the return offered by the company to make the contract "good business" from the point of view of the doctor

All classes of Insurance are dealt with, and the Medical Insurance Agency secures reductions of premiums in nearly every case

Since last winter further service has been offered by the provision of free expert advice, born of skill and experience, in any matter relating to the purchase, use, or sale of Motor Cars

AT THE MOTOR SHOW THIS YEAR

the Consulting Engineers to the Agency, Messrs MANN, EGERTON & CO, LTD, have arranged for a number of representatives from their various departments to be at the service of Medical Men, with a view to advising them on any technical or business matters on which they require assistance

You help yourself and the Medical Charities by CONSULTING THE AGENCY which has SAVED £14,000 by way of reductions on Premiums CONTRIBUTED £11,500 to the Charities

Strong—
yet sterilized 16 times

Sterilization destroys an ordinary Rubber Surgeon s Glove
MADERITE Seamless Rubber Gloves have been sterilized from 16 to 20 times—yet still retain their tensile strength
This is because MADERITE Gloves are made from the heart of para rubber biscuits from the wild rubber trees of Brazil the oldest and strongest rubber in the world
The process of manufacture ensures a glove of even texture and remarkable strength
MADERITE Gloves are available in all sizes rough and smooth and in two varieties
1 The ordinary glove for minor operations Medium smooth heavy smooth and medium rough
2 The autopsy glove reaching to the shoulder for post mortem work.

Artificial Limb Manufacturers

Established 1793 — 7 CHERRY ST. BIRMINGHAM and at LONDON

Our Japnamel Surface has been used with advantage by the leading Hospitals, Nursing Homes, and Municipal Bodies in the country

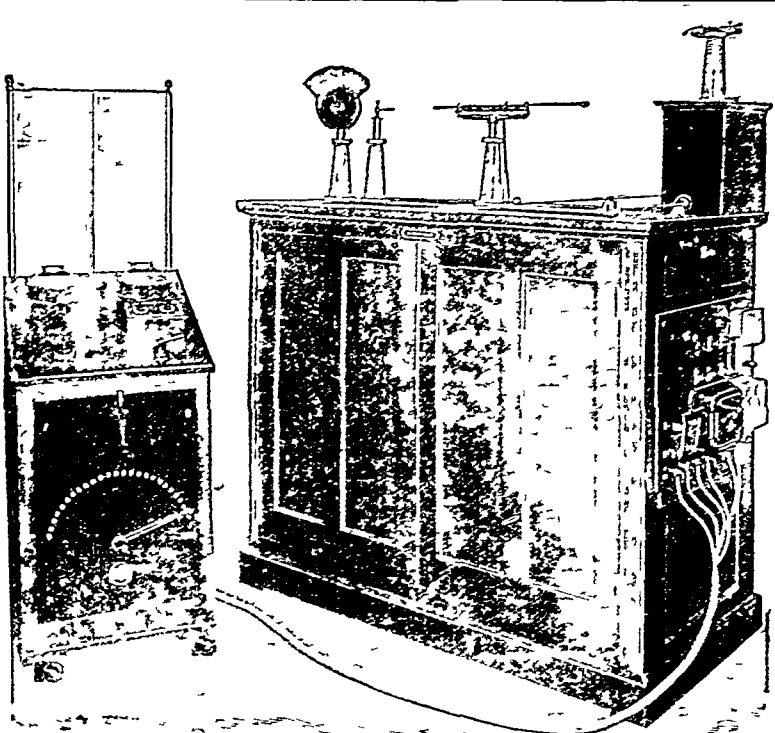
A pound saved is as good as a pound donated

Hospitals can make their equipment and furniture as good as new—and save much expense—by having it re-enamelled with Price's Porcelain Solution

Let Prices do it in the way that 60 years' experience has taught them it should be done

Work done Prices way gives a hard durable finish which will not crack—thus minimising the danger of bacteria collecting

Moreover, the surface can be washed with disinfectant, turpentine, or methylated spirit—without fear of damage



Prices prices are moderate and the most modern plant is at your service for japanning and enamelling

Write for our representative to call and estimate

THE

RADIOSTAT

OIL-IMMERSED HIGH-TENSION TRANSFORMER

For Coolidge or Gas Tubes

The Model illustrated is our Standard 10 K.V.A. Set with Switchtable Control and it is manufactured for either D C or A C Mains Of our usual sound design and robust construction with exceptionally high output

A recent letter from Scotland —

There is no doubt it is a good machine *In fact it is so good that one forgets all about it* and the only part I pay any attention to is the Coolidge Ammeter The rest can be forgotten provided the other controls are always kept constant. So like the Rolls-Royce it only requires to be kept clean."

A descriptive brochure will be sent post free on application to the SOLE MAKERS,

The Medical Profession recognises the Therapeutic Value of Sphagnol.

We desire to give every doctor an opportunity of forming an independent opinion on the merits of Sphagnol Send us your professional card and we will forward a sample box containing one tin of ointment one tablet of toilet and medical soaps and one shaving stick

No less than 10,000 medical men have tested Sphagnol Preparations In many cases particularly long-standing and intractable diseases were treated with complete success, and eminent skin specialists have expressed interest at the surprisingly speedy results achieved through the use of these specifics

Testimonial follows testimonial from many doctors who in day to day practice are obtaining satisfactory cures for old and long-standing diseases, and from not a few who have discovered new uses for this valuable addition to British therapeutic resources

The use of Sphagnol is invaluable in diseases such as Acne, Alopecia, Anal Fissure, Blepharitis, Dermatitis, Eczema, Erysipelas, Hæmorrhoids, Impetigo, Chilblains, Sunburn, Insect Bites, Prickly Heat, Pruritus, Psoriasis, Falling Hair, Scabies, Septic Wounds, Urticaria, Burns, etc

Spha•nol

SOAPS, OINTMENT, LOTION etc

For Dispensing, Sphagnol is available in 1 lb Jars and Tins, and is supplied to the profession at special terms

When breast milk is deficient prescribe Trufood —a close approximation to human milk

Humanised Trufood is made from pure Cheshire dairy milk, from which excess casein has been separated and to which cream and lactose are added, so that the final composition corresponds to that of human milk The comparative analysis below shows how near to breast milk is Trufood

	Breast Milk	*Cow's Milk*	*Humanised Trufood*
Lactose -	6 5	4 7	6 25
Fat -	3 3	3 5	3 45
Casein -	0 9	3 0	0 80
Lactalbumen -	0 4	0 3	0 60
Salts	0 2	0 8	0 65
Water	88 7	87 7	88 25
	100 0	100 0	100 0

No other baby food corresponds closer to nature

The resemblance to breast milk is even closer than is revealed by the above data, since both enzymes and vitamins are present as in human milk This is owing to the fact that in the Trufood process the optimum temperature reached is 145°F, whereas the dried milks offered as baby foods are in most cases heated up to 220/240°F with resultant loss of enzyme and vitamin contents

You are invited to apply for reproduction of actual photograph (in colours) of a recent incubation test of various milks This is obtainable either by post or at the TRUFOOD STAND (Nos 12 3 and 13 3) at the London Medical Exhibition

Samples adequate for full clinical trial, together with descriptive literature, on request

REPRESENTATION OF LEÏ TSU THE LADY OF SI LING THE PIONEER OF SERICULTURE ACCORDING TO CHINESE LEGEND —We owe to the Chinese the art of producing silk. The real date and circumstances of its origin are not known, but the Chinese trace it to a woman Lei tsu, wife of the great Hiang ti, the "Yellow Emperor" who lived in the third millennium B C She is said to have discovered and taught the art of rearing silk worms, and to have invented the loom. She was deified in consequence and is still worshipped at a yearly ceremony in which the ritual of plucking mulberry leaves is observed. The production of silk in China must have been carried on there centuries before it was known elsewhere. The Chinese philosopher and teacher Mang tse (better known under the latinised form of his name, Mencius) makes a definite reference to silk, 372 289 B C The Chinese spared no effort to guard their secret from becoming known outside their border and the industry was strictly supervised in all its branches by government officials China alone was the source of silk until the third or fourth century A.D, when the knowledge of its manufacture reached Japan through Korea. It reached Europe overland. It is said that silk worms eggs brought concealed in a bamboo tube to Constantinople in the sixth century A.D., became the source of supply to the West. We owe to Aristotle the first mention of silk in European literature. In the time of Aurelian silk was worth its weight in gold in Rome. The Greeks called the Chinese nation Seres (from ser silk worm)

Appendicular appearances

Chronic appendicitis with adhesions

Lubrication Therapeusis.

AN EMINENT PHYSICIAN HAS DIVIDED APPENDICITIS INTO FOUR CLASSES

1 *Gangrenous*—chances of recovery by surgical interference problematical

2 *Pre gangrenous* — single severe attack with major constitutional symptoms Chances of recovery by surgical interference very good

3 *Single mild attack*—surgery inadvisable Medical Treatment usually efficacious

4 *Recurrent mild attacks or chronic appendicitis*—symptoms which clear up under ordinary dietetic and hygienic regimen

A lubricant, he states, taken in cases of recurring attacks, has proven itself the best preventive measure yet devised

As you know, the usual drug laxatives and cathartics or the over residuized diet resorted to so often in these cases tend to bring on attacks, first by their irritant action on the intestinal mucous membrane, and second by the exaggerated peristalsis produced The latter action may carry concretion material into the appendix or may exercise it when immobilization of the organ is the indication

Nujol, because of its soothing, lubricating action and softening effect on fecal matter may prevent a recurrence of appendicial attacks or minimize the severity of these attacks

Nujol, the ideal lubricant, is the therapeutic common denominator of all types of constipation Microscopic examination shows that too high a viscosity fails to permeate hardened scybala Too low a viscosity tends to produce seepage Exhaustive clinical tests show the viscosity of Nujol to be physiologically correct and in accord with the opinion of leading medical authorities

The 'Allenburys' LIQUID BEEF

A VALUABLE AID IN THE NOURISHMENT OF INFANTS, INVALIDS AND CONVALESCENTS

Stimulating, Strengthening and Sustaining

'Allenburys' Liquid Beef presents in a concentrated and palatable form the valuable constituents of fresh beef juice It contains the soluble albuminoids, vitamins, extractives and salts of prime lean English beef in an unaltered and easily assimilable form This preparation is superior to beef-tea or the ordinary meat extracts, which for effect depend principally on their stimulant action but possess little or no direct nutritive value

The 'Allenburys' Liquid Beef is very beneficial in Anæmia, Acute Dyspepsia, Asthenia, and during convalescence It is invaluable for infants and weakly children

The price has been reduced to 3/- per bottle.

Full particulars and clinical trial sample will be sent post free to members of the medical profession.

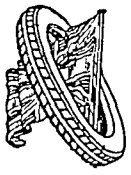
BRITISH MOTORISTS!
Follow the Car Makers' Lead—
'fit Dunlop and be satisfied'



THE BRITISH CARS named here fit Dunlop Tyres as Standard equipment Think of it! Practically every British manufacturer of repute has selected the same make of tyre as best fitted to uphold the reputation of his product

Many of the manufacturers have already completed arrangements with us for 1925—either for standard Dunlop or the new Dunlop Balloons

If your present car is needing new tyres, be sure to have Dunlop, they give better service at lower cost

If you are contemplating the purchase of a new car, or the conversion of your present car to Balloon equipment, investigate what Dunlop has to offer

Manufacturers' requirements are being met first of all, but Dunlop Balloons—the safest of all low-pressure tyres—will shortly be available for every motorist

Wherever they sell tyres they recommend Dunlop. The best in the World and BRITISH!

GALL STONES AND CANCER OF THE GALL BLADDER:

AN EXPERIMENTAL STUDY *

BY

ARCHIBALD LEITCH, M.D.,

DIRECTOR OF THE CANCER HOSPITAL RESEARCH INSTITUTE, LONDON

(*With Special Plate*)

We have succeeded in producing cancer experimentally in animals by the use of various special agents. Fibiger[1] produced it by the nematode *Spiroptera neoplastica*, Bullock and Curtis by another parasite, the *Cysticercus fasciolaris*, and Yamagiwa and Ichikawa by coal tar. In our own laboratory we have produced cancer by coal tar[4] and tar extracts,[5] by pitch,[6] by soot, by arsenic,[7] by shale oil and industrial oils derived from shale,[8] by crude petroleums and lubricating oil, and by a tarry substance prepared from isoprene.[9] Bloch,[10] and, probably before him, Marie, Clunet, and Raulot-Lapointe,[11] induced it by means of x rays. In addition to these cancer producing agents, we have in the human subject others, the relation of which to cancer cannot reasonably be doubted, though they still lack experimental confirmation: the heat of the kangri-pot causing epithelioma of the thighs and abdomen amongst the natives of Kashmir[12], the betel preparation associated with buccal cancer in Asia[13], the bilharzial ova inducing vesical and intestinal cancer in Egypt[14] and Japan, and several others less definitely established.

But these known irritants are responsible for a very small proportion of the cancers that occur. They are all of extrinsic origin and entirely foreign to the economy. They act, presumably, not as simple mechanical agents, but in virtue of some peculiar property they possess. Even if we give full scope to our imagination we cannot inculpate any analogous external irritants in the generality of human or animal cancers. If we are to establish the irritation theory of cancer on a broader and surer basis we must search for possible internal irritants. I have therefore been led to the conclusion that substances capable of producing cancer by their prolonged action on the tissues may be elaborated within the body as the result of other pathological processes. In other words, the main mass of carcinogenic agents are endogenous. How these originate we may sometimes guess of their chemical nature we are at present entirely ignorant. To entertain such a belief as this is legitimate, but to seek to promulgate it without proof is to hinder rather than to help scientific progress. At first I endeavoured to produce cancer by substances which might be considered as intermediate between wholly extrinsic and wholly endogenous. Knowing that cancer of the intestines progressively increases in frequency from the duodenum to the rectum and that putrefactive changes in the bowel contents increase in parallel, I selected at random certain products of intestinal putrefaction, such as skatol, paracresol, tyrosine and methyl-mercaptan, and introduced these into the lower bowel of mice, rats, guinea-pigs and rabbits, thrice weekly for many months, but without producing any signs of tumour formation. Of course, there are numerous other putrefactive products that we might use, and we might be fortunate with some of them. Similar use of a tar extract which proved to be very potent in inducing epithelioma when applied to the skin of mice failed to produce intestinal cancer in any of these four species of animals. There is in the human subject, however, one outstanding cancer, cancer of the gall bladder, which is closely associated with a particular irritant and an irritant moreover, which is entirely endogenous. To this we have directed our investigations.

* Delivered at the Isle of Thanet Division of the British Medical Association on May 20th, 1924.

GALL STONES AND CANCER IN MAN

It is beyond the scope of this paper to discuss the etiology of gall stones. It was formerly believed that gall stones originated in the gall bladder owing to stasis of the bile and acute inflammations of the viscus, but this is now discounted, and it is becoming more generally accepted that the part played by the gall bladder is quite secondary, or even passive, and that in all probability there is no lesion in that organ preceding the formation of the calculi. Possibly in the majority of cases gall stones give rise to no definite symptoms during the life of the person and are only discovered *post mortem*. The statistics as to the frequency with which they are found vary from 1·5 to 25 per cent., according to the age composition of the hospital patients. Schroder,[15] who analysed von Recklinghausen's autopsy records, found that 12 per cent. of all persons had gall stones, they were rare under the age of 30 (3 per cent.), they were found in 10 per cent. of the cases between the ages of 30 and 60, whilst 25 per cent. of people over 60 years of age had gall stones. They are thus quite common. Cancer of the gall bladder is by no means a rare disease. Kaufmann[16] states that according to the Breslau statistics it forms 5 per cent., and to the Basle statistics 5·19 per cent., of all carcinomata coming to autopsy. Now, in cancer of the gall bladder gall stones *are generally present*. In 263 cases collected by Futterer and Haberfeld they were present in 70 per cent., in Musser's series in 69 per cent., according to the figures of St. George's Hospital (Polleston) in 75 per cent., Winton gives 81 per cent., Zenker 85 per cent., Courvoisier 91 per cent., Siegert 95 per cent., and Janowski 100 per cent.[1] As these figures have been compiled from *post-mortem* records we cannot conclude that gall stones were absent unless there was a definite statement to that effect. Musser, however, states that in 3 of his 100 cases calculi could not be found, and several other writers have noted the occasional absence of gall stones. In what proportion of cases of gall stones does cancer of the gall bladder occur? The statistics on the point are surprising. The lowest figure I have found is that given by Candler[17] from asylum practice—namely, 2 in 315—and the highest that by Slade,[18] 30 per cent. Rolleston gives 4·5 per cent., Mayo slightly under 5 per cent., Moynihan 5 per cent., Pridel 7 to 8 per cent., Mayo-Robson 10 per cent., Schroder 14 per cent. Slade's figures (30 per cent.) are certainly much too high: they were based on an exceptional sample, and some of his illustrations would fail to convince a pathologist of the accuracy of the diagnoses. If we put the figure at 5 per cent. we shall probably be safe, but even if we bring it down to Candler's low estimate it will still be a surprisingly high incidence if we consider how low the incidence of cancer is amongst those who are subjected to other cancer-producing irritants. Probably less than 1 in 1,000 of pitch workers, tar distillers, paraffin-oil refiners, and betel chewers, ever develop their peculiar cancer: though, on the other hand, the early x ray operators had an extraordinarily high incidence.

Taking all these facts into consideration—that over 10 per cent. of adults have gall stones, that 5 per cent. of these develop cancer of the gall bladder, and that gall stones are present in practically all cases of gall bladder cancer—we have good grounds for believing that cancer of the gall bladder is the result of the irritation set up by the gall stones. On the other hand, some have maintained that the calculi found in cases of carcinoma are the consequence of the carcinoma and not its cause. Such a view cannot lightly be dismissed. If we accept the vesical origin of gall stones we must admit that such a gross lesion of the epithelium as carcinoma will be likely to induce the formation of calculi, either by reason of some exaggerated or pathological secretion of the malignant cells or by the detachment of tissue fragments that may serve to form nuclei for the deposition of cholesterin from the bile. Gall stones however, are not specially frequent in cases of metastatic nodules in the gall bladder wall. Secondly, gall stones are sometimes absent in gall bladder cancers. To this very important objection it may be replied that in no case can we be sure that gall stones were not present at some previous time, they may have escaped through the bile duct or have

ulcerated into an adherent portion of bowel Mr F K Smith of Aberdeen has been kind enough to supply me with notes of a case of carcinoma of the gall bladder which occurred six years after stones had been removed from that organ Thirdly, simple tumours of the gall bladder are very rare, and, if we bear in mind the frequency with which true malignant tumours are preceded by benign neoplasia in other instances of irritation cancers, we should expect to encounter the preliminary simple tumours much more commonly, especially in *post-mortem* examinations I have seen two specimens of simple tumours of the gall bladder removed by operation, in neither were gall stones present, nor was there any sign or history pointing to their previous presence In the few cases of benign tumours of the gall bladder on record stones were absent in half the number Lastly, we have no convincing examples of cancer being caused by purely mechanical irritations, calculi in other situations, such as the urinary bladder or appendix, are seldom associated with malignant tumour formation It may be, of course, that the action of the gall stones is not purely mechanical, then chemical composition may be the important factor, and my colleague Dr H J B Fry has had some interesting experimental results indicating that the action of a weak tissue irritant, insufficient by itself to initiate tumour formation, may be considerably reinforced by cholesterin

We are thus confronted with a difficulty which cannot be solved by clinical observations and disputations Are the gall stones the cause of cancer of the gall bladder, or does cancer of the gall bladder bring about the formation of the gall stones? The hazard of experimental investigation was peculiarly alluring, for successful results would not only solve this long-debated question, but would encourage us to pursue, in spite of failures, our quest for endogenous causes of cancers But the omens were not wholly favourable

Experiments on Animals

Hitherto we have had no experimental proof that purely mechanical irritation is capable of inducing tumours In my own attempts with such irritants I have failed Bullock and Rohdenburg,[20] in criticizing Fibiger's original experiments, maintained that only excessive hyperplasia of the gastric epithelium had been induced by the mechanical irritation of the spiropterae, and they claimed to have produced similar lesions in the rat's stomach by inserting pieces of sponge into the cavity Their criticism of Fibiger's results, of which they had not fully informed themselves, was unfortunate, but it has always seemed to me that if they had given longer time to their experiments they might have succeeded in producing actual epithelioma Just before my experiments were commenced, Kazama[21] claimed to have induced tumours of hollow viscera in a variety of animals by various mechanical and chemical forms of irritation, such as invaginations of mucosa, insertion of sutures, and injections of lanoline and other substances The English translation of his paper was rather obscure, but one of his tables showed that, amongst other things, he had introduced pebbles into the gall bladder of dogs, rabbits, and guinea-pigs He used 30 guinea-pigs, which survived the operation from 1 to 116 days, and he claimed to have produced in them the following results "papillous growths, 6, heterotopic glandular growths, 10, heterotopic or atypical growths, 3, atypical growths, 5, early adenocarcinoma, 3, adenocarcinoma and metastasis, 4," the latter being in the chest wall in 2, in the intestines in 1, and in the liver in 1 Unfortunately this shows that the number of positive results exceeded the number of animals, and the claim seems the less convincing when we notice that at least one of the animals died within a day or two of operation and none survived for four months In instituting my own experiments I had to face the fact that the gall bladder of mice is much too small for operation, and that rats, which would otherwise have been the animals of choice, do not possess a gall bladder Rabbits were too large to use in sufficient numbers Guinea-pigs, which would be ideal in many respects, are peculiar in that they are not naturally affected with cancer, and that we have always failed to induce tumours in them by any of the various means we have adopted with success in other species of animals It may even be said that they practically never develop any sort of tumour When one remembers that hundreds of thousands of guinea-pigs must have been examined throughout the laboratories of the world and yet the only instance of a tumour being recorded was that mentioned by J A Murray[22]—a transplantable lipoma—the apparent natural immunity of these animals to the causal agent or agents of cancer will appear all the more striking Nevertheless we employed guinea-pigs in our experiments, and the result has been successful beyond our hopes

Author's Experiments on Animals

An area over the lower part of the chest and the upper part of the abdomen was epilated by means of sodium sulphide (10 per cent solution) and rendered aseptic by the application of violet-green solution (0·5 per cent brilliant-green and 0·5 per cent methyl-violet in 50 per cent alcohol) Sterile sheets covering the rest of the animal were clipped on to the edges of the operation area, and the abdomen was opened by an incision running parallel to the lower ribs The very thin-walled, semi-transparent, spherical gall bladder was readily found and steadied by two small forceps half an inch apart, and a small incision, just sufficient to admit the foreign body, was made with fine scissors When this was inserted, the cut edges were united by means of a continuous suture of the finest catgut obtainable threaded on a fine needle, and the two ends of the suture were tied together It will thus be seen that the ridge projecting into the lumen was doubled on its length, and would therefore appear, when viewed from the inside, as more or less of a nodule It is important to bear this in mind when considering the changes that one might be inclined to attribute to the action of foreign bodies, especially as the displacement and irregularity of the mucosal elements, when seen in microscopic section, will be much exaggerated and will provide a histological picture that may tempt the uncritical to conclude that a small tumour, even of a malignant nature, has been produced It seemed to me in reading Kazama's communication, and studying the photomicrographic illustrations that appeared in a subsequent paper by him, that this was the criticism that must be passed on his findings, and, indeed, the examination of the conditions in those animals of mine that died within a short time of the operation supported that judgement

In 25 guinea-pigs I inserted one gall stone, sometimes two, into the gall bladder These gall stones, roughly about the size of lentils, had been removed four years previously from a patient with cholelithiasis and had been kept in a dry state They were not sterilized before use It may be mentioned, in view of Lazarus-Barlow's statement[23] that gall stones associated with gall bladder cancer contain radium while others do not, that I had these calculi examined by our physicist, Mr C E S Phillips—using methods that would be approved by physicists—but they did not contain any perceptible trace of radium In 5 cases small, smooth pebbles, sterilized beforehand, were used as the foreign bodies, in another batch of 5, pilules of pitch were inserted Finally, I injected melted lanoline by means of a hypodermic syringe into the gall bladder of 5 animals, but the puncture wound had to be closed by a stitch To enable us to identify each animal, coloured charts of the markings of all the guinea-pigs were made at the time of operation

The experiments in which lanoline had been injected can be dismissed quite briefly as they yielded no positive results Three of the animals, Nos 36, 39, and 40, died eleven days after operation, and in all three there was complete desquamation of the lining epithelium with absence of the gland tubules save at their deepest parts and more especially at the site of the needle puncture where a stitch had to be inserted Here the displacement and irregularity of the tubular epithelium might give rise to a suspicion of early malignancy, but such an appearance is merely temporary and the normal condition is afterwards restored, as could be seen from an examination of the gall bladder of No 37, which died at the end of five and a half months (Fig 1) The fifth guinea-pig, No 38, is still alive eighteen months

after operation, and when its gall bladder was inspected by exploratory operation exactly a year after the lanoline had been injected it was found to be perfectly normal

The solid foreign bodies—gall stones, pebbles, and pitch pellets—gave results comparable to each other, and we may consider them together in the order in which the animals died Two guinea-pigs with gall stones, Nos 7 and 9, died within a few days of operation, as the result of tearing out their stitches

[The illustrations of gall bladders with adjacent liver tissue reproduced in the special plate were photographed from the remnants left after providing material for histological purposes, and do not adequately represent the conditions that presented themselves originally to the naked eye For the photographs and photomicrographs I am much indebted to Dr D J Reid]

No 2) Gall stone inserted on January 15th 1923 Died on January 29th (2 weeks) The lining epithelium and the more superficial portions of the tubules were destroyed Displacement and irregularity of the gland epithelium in the vicinity of the ulcers

No 18 Gall stone inserted on January 11th 1923 Died on February 13th (1 month) The gall bladder was contracted and its opaque walls were irregularly thickened to 2 mm or more The superficial and gland epithelium was destroyed leaving the interlobular connective tissue projecting bare into the lumen (Fig 2) Deep in the thickened wall there were well preserved though irregular portions of the gland tubule

No 31 Pellet of pitch inserted on January 17th 1923 Died on May 7th (3½ months) The pitch lay in a small smooth cavity in a thick walled fibrous mass which represented the gall bladder For the most part the lining membrane had been destroyed, but over one third of the circumference of the cavity it had been converted into squamous epithelium and underneath this the muscular layers were intact and there was no trace of tubules At other parts of the thickened wall there was considerable and very irregular proliferation of the glandular epithelium amongst new formed connective tissue, along with disintegration of the muscle bundles (Fig 3)

No 11 Two gall stones inserted on January 9th, 1923 Died on May 5th (4 months) The gall bladder wall was slightly thickened rough and contracted over the calculi The superficial epithelium had been lost but was being regenerated from the deeper parts of the tubules which were actively proliferating

No 24 Two gall stones inserted on January 15th 1923 Died on June 11th (5 months) The gall bladder was enlarged and on section apparently multilocular but the walls were not much thickened except in the loculus containing a stone where they were over 2 mm in thickness (Fig 4) Sections through the latter part showed much hyperplasia of gland epithelium with numerous cysts The condition might be described as *cystadenoma or doubtful* nature A small hard subcutaneous nodule was found in the chest wall opposite the liver but on micro-copic examination this was seen to be composed of fibrous tissue only

No 26 Pebble inserted on January 16th 1923 Died on July 1st (5½ months) The gall bladder was represented by an irregular moderately hard whitish mass adherent to the liver and at one part insensibly blended with it The liver substance contained numerous white irregular areas and on the under surface of the liver there was a subcapsular prolongation from the fundus of the gall bladder (Fig 5) On section the mass was solid save for a central cavity occupied by the pebble on which there was a thin greenish deposit Micro copic preparations showed adenocarcinoma of the gall bladder the appearances being repeated in the subcapsular prolongation and in the white areas in the liver substance (Fig 6)

No 21 Gall stone inserted on January 15th 1923 Died on *July 2nd* (5½ months) There was a small bare area of skin over the lower rib with indefinite thickening underneath it The gall bladder enlarged and hard was *adherent to the chest wall opposite* this area Section through the gall bladder showed it to be thick walled loculated and in direct continuity with a whitish patch underneath the skin Microscopic examination revealed adenocarcinoma of the gall bladder invading the chest wall and eroding and *destroying* the rib cartilages This formed one part of the subcutaneous nodule but the greater part of it was composed of loose fibrous tissue

No 27 Pebble inserted on January 16th 1923 Died on July 2nd (5½ months) The gall bladder wall was thin for the most part but was thickened towards the fundus where the pebble lay Micro copic examination showed an apparently simple hyperplasia of the gland tubules

No 1 Gall stone inserted on January 3rd 1923 Killed on July 3rd (6 months) The thin walled gall bladder was firmly contracted round the calculus and gave no evidence of neoplasia

No 10 Two gall stones inserted on January 11th 1923 Died on July 8th (6 months) The gall bladder was very small and contracted over the stones The wall was thin and translucent

No 9 Gall stone inserted on January 15th 1923 Died on July 14th (6 months) The liver was firmly adherent to the lower ribs and on removing cartilage and on being separated disclosed a mass of fibrous tissue which was in direct continuity with the gall bladder The latter was thick walled and had a central cavity occupied by the calculus and another smaller empty loculus (Fig 7) Microscopic examination of sections showed very great proliferation of tubular epithelium in the wall of the gall bladder and also in the fibrous mass The adenocarcinoma invaded the ribs (Fig 8)

No 14 Gall stone inserted on January 9th 1923 Died on July 15th (6 months) The anterior surface of the liver was adherent to the diaphragm and ribs but these were easily separated and left an extensive white patch on the liver surface The gall bladder continuous below with this patch was represented by a whitish solid mass fading insensibly into liver tissue (Fig 9) Histological examination revealed extensive proliferation of tubular epithelium the walls of the tubules being generally one cell thick infiltrating and destroying the liver parenchyma (Fig 10)

No 32 Pellet of pitch inserted on January 17th 1923 Died on July 17th (6 months) There was a subcutaneous nodule over the lower ribs and on the under surface of the liver there was a large irregular bulging whitish mass merging insensibly into the liver substance (Fig 17) On section this mass was found to be continuous with one end of a shrunken irregular thick walled gall bladder and on the other side with the subcutaneous nodule For the greater part the mass was necrotic but at its margins it was white and glistening and evidently spreading into the liver substance (Fig 18) Micro-copic examination of the necrotic portion showed dense areas of leucocytes surrounding the remains of tubules whilst the white marginal portions exhibited masses of dilated and irregular tubules infiltrating and destroying the liver parenchyma almost to its surface (Fig 19) The subcutaneous nodule was composed of young fibrous tissue in the centre of which were indefinite remains possibly of tubules

No 4 Gall stones inserted on January 9th 1923 Died on August 7th (7 months) The gall bladder was contracted with thick soft pongy walls not sharply delimited from the liver (Fig 11) Microscopic examination showed very irregular proliferation of gland tubules which were not traced into the liver substance but approached very closely to it (Fig 12)

No 22 Two gall stones inserted on January 15th 1923 The guinea pig remained in apparently good health and an exploratory operation was performed on January 15th 1924 (1 year) The animal died two days later from internal haemorrhage resulting from the breaking down of adhesions The duct end of the gall bladder was thin walled and dilated but the fundus was represented by a hard mass buried in the liver substance and containing a single stone the other stone being in a diverticulum of the cystic duct (Fig 13) Micro-copic examination revealed adenocarcinoma of the gall bladder just *beginning to infiltrate* the liver substance (Fig 14)

No 13 Gall stone inserted on January 9th 1923 An exploratory operation was performed on January 9th 1924 when on separating adhesions the gall bladder was found to be small fairly translucent and apparently not thickened The stone was easily palpable A loop of intestine was torn and the animal died of peritonitis on January 18th (1 year 9 days) Section through the liver and adherent gall bladder showed that though the aspect of the bladder seen at operation was no much altered the side adherent to the liver was irregularly thickened and a somewhat haemorrhagic prolongation from it penetrated into the liver substance Growing from this side of the gall bladder was a sessile pedunculated mass of tissue projecting into the cavity and filling it save for the part occupied by the stone (Fig 15) On microscopic examination this tumour mass was seen to be composed of a very cellular stroma embedded in which were narrow irregular tubules (Fig 16) At other parts the tubules were large and irregular and lined with many layers of tall columnar epithelium These structures were traced for some distance into a cirrhotic liver

No 29 Pebble inserted on January 19th 1923 Exploratory operation on January 29th 1924 revealed dense adhesions around a hard mass occupying the position of the gall bladder and on trying to separate these the liver was torn and the animal died from internal haemorrhage next day (1 year 10 days) On subsequent dissection the intestines and omentum were found to be normal adherent to the gall bladder which on the other side was adherent to the body wall The gall bladder itself was a hard mass solid save for the small cavity in which the stone lay and in this mass there were patches of whiter tissue along with haemorrhagic areas (Fig 20) At some parts the wall was three eighths of an inch thick The stone had a thin coating of brown pigment Microscopically the wall of the gall bladder was represented by excessively and irregularly proliferated tubular epithelium set in areas of dense connective tissue (Fig 21) Within this mass areas of liver cells were found (Fig 22) Part of the epithelium lining the small cavity was converted into squamous epithelium (Fig 23) and several of the dilated tubules contained deeply staining concretions The adherent omentum was infiltrated with malignant cells (Fig 24) but the process could not be traced into the muscles of the abdominal wall

In addition to these, 11 with gall stones 2 with pebbles and 2 with pitch pellets were still alive at the end of fifteen months All these have undergone exploratory examinations on the anniversary of their first operation, but it was impossible to say how many of them were malignant owing to the restricted examination permitted by adhesions The two with pebbles had apparently more or less normal gall bladders In one of the pitch cases the condition was doubtful, and in the other the appearances seemed to exclude malignancy Of the 9 with gall stones, 3 were considered to be malignant, 3 doubtful, 3 shrunken without signs of growth, and 2 thin-walled, distended, and probably normal The final reckoning of the success of the experiments must await a later examination of those animals that still remain alive

DISCUSSION OF RESULTS OF EXPERIMENTS

It will be seen from the experiments detailed above that the lesions produced in the gall bladder by the solid foreign bodies gradually increase in severity according to the length of time the animals survived Soon after their introduction there is denudation of the epithelium lining the viscus, followed later by regeneration from the portions of the gland tubules set deeper in the wall The activity of this tubular epithelium, accompanied by activity of the stroma, becomes more and more marked, the constant trauma exerted by the foreign body, perhaps accentuated by efforts at expulsion, producing repeated destruction of the surface epithelium and repeated replacement from the gland epithelium In some cases a state of equilibrium is attained, the wall of the gall bladder either being restored to its normal condition with the calculus lying free in the cavity or, owing to the formation of fibrous tissue, contracting down tightly over the stone, when proliferation ceases In the majority of instances, however, the epithelial activity continues, the tubules growing this way and that through the wall We have no landmarks to guide us, the muscular bundles do not form, even in the normal gall bladder, an unbroken investment over the glandular layer, and in these experiments the muscle fibres are broken up and often wholly destroyed We have, therefore, no means of determining when the heterotopy and irregular growth of the tubular epithelium ceases to be translatable as simple hyperplasia and assumes the definite characters of malignant neoplasia, and the difficulty is increased by the fact that frequently, but not invariably, the lining of the proliferating gland tubules, no matter how irregularly or how far they ramify, remains one cell thick, and the nuclei, at all times poor in chromatin, seldom take a deeper stain It is only when neighbouring tissues are invaded that we have allowed ourselves to consider the process malignant Short of that there is considerable room for difference of opinion It is thus impossible to say in how many of our experiments cancer was produced To my mind, Nos 26, 21, 5, 14, 32, 22, 13, and 30—all of which showed involvement of adjacent structures—are beyond reasonable doubt malignant On the other hand, none of the animals that died within four months presented any lesion that should be regarded as more than regenerative hyperplasia, but the process is so gradual and the dividing line so imperceptible that Kazama's claims regarding his experiments, which at first I was inclined to reject, should not be dismissed as groundless, and doubtless he would have obtained indisputable carcinoma in some cases had his animals lived longer

The feature of these tumours is the invasive character of the growth, and the liver becomes involved by continuity and not by metastatic process The infiltration is generally confined to the lobe to which the gall bladder has adhered or two adjacent lobes between which it has become wedged, and in no case has the process spread to lobes at a distance In histological preparations it is not always possible to distinguish a bile ductule from an invading tubule, but the great irregularity of the proliferation in most cases leaves little room for doubt From the mass in the liver, or more directly from the gall bladder, the diaphragm or abdominal muscles in the vicinity are invaded, and the process in its extension destroys the ribs, forming a perceptible subcutaneous nodule In two such nodules the striking thing was the amount of young fibrous tissue and the absence or scarcity of epithelial cells within it This is possibly due to the necrosis and absorption of the malignant cells owing to the poorly developed vascular supply In No 32 this necrosis is specially evident in the greater part of the mass in the liver, the living and active tissue being at the periphery The involvement of the omental fat shows the true invasive character of the growth, and here the cells have entirely lost their tendency to associate in tubule formation It will be seen that there were no distant metastases in any of the cases The absence of distant metastases and the spread of the process by mere continuity of tissues are quite usual features in carcinoma of the human gall bladder The metaplasia of the lining columnar epithelium into squamous epithelium, a form more suited to withstand mechanical irritations, seen in two of the cases, is a not uncommon finding in chronic cholecystitis and in carcinoma of the gall bladder in the human subject

No difference could be found between the solid foreign bodies in respect of the lesions they produced they were equally effective The fact that pebbles produced the same results as the gall stones shows clearly that the chemical composition of the calculus plays no part in the process. They supply a purely mechanical stimulus to the cells The fact that sterilized pebbles and sterilized pitch pellets brought about the malignant proliferation just as readily as the unsterilized gall stones demonstrates that the effects of the latter were not due to any living virus they contained, and the fact that lanoline, soft and incapable of causing repeated cell trauma, did not induce exuberant proliferation would seem wholly to negative the suggestion that some mysterious cancer-producing agent was unwittingly introduced from without when the foreign bodies were inserted into the gall bladder There still remains the assumption that the action of the solid foreign bodies resulted only in the production of a pathological condition of the tissues of such a nature as to allow of the operation of some other causal agent for the cancer "Cancer"—so the fatuous platitude runs—"never starts in healthy tissues" As in our previous experiments in cancer production so also in this, the evolution of the stages of the lesions is so gradual that it is impossible to find a point at which we could conceive of one causal factor giving place to another of a different order Here we have a species of animal in which neither a carcinoma of the gall bladder nor a carcinoma of any kind has ever been found in nature, and yet, when we expose a certain tissue to a mechanical irritation to which that tissue has never been previously subjected, carcinoma results Are we to imagine that the tissues of the guinea-pig are never subjected to irritations of any kind, and that no condition suitable for the hypothetical agent of cancer is ever produced in them naturally? Are we to imagine that this undiscovered agent lurks in each guinea-pig's body and has never before had an opportunity of producing cancer until we introduced solid foreign bodies into a certain viscus? The simplest explanation, and that which will probably appeal to most of us, is that the constant mechanical irritation of the calculi, operating on a suitable tissue, such as the gall bladder proved to be, alone produced the carcinoma

CONCLUSION

From these experimental results we may conclude that, in the human subject, gall stones are capable of causing cancer of the gall bladder Freely admitting that they do so in a comparatively small proportion of cases, we may premise that in some individuals there is a natural resistance to carcinogenic agents, just as there is a natural resistance to pathogenic organisms, and, learning from our previous experiments that similar tumours may be produced by wholly dissimilar agents, we may account for the carcinomata of the gall bladder which are found in the absence of gall stones as being due to some other causal agent or agents not yet identified

THE TREATMENT OF PERNICIOUS VOMITING IN PREGNANCY BY GASTRIC LAVAGE AND CARBOHYDRATE RECTAL FEEDING

BY

STANLEY E DENYER, C.M.G., M.A., M.D. CAMB., F.R.C.S. ENG., M.R.C.P. LOND.

PHYSICIAN, HULL ROYAL INFIRMARY; SPECIALIST IN NEUROLOGY MINISTRY OF PENSIONS

Various views have been put forward as to the cause of the morning vomiting of pregnancy, which occurs from the sixth to the fourteenth week, and is more common in primigravidae than in multiparae. It usually occurs in the early morning, and where the condition becomes aggravated it occurs throughout the day. In the severest cases it may become almost continuous.

The views that have been held include as causes toxaemia, hysteria and a reflex type. The view that it is due to a deficiency of glycogen in the maternal liver was put forward by Duncan and Harding in 1918, and the case given below was treated in accordance with it.

Mrs. H., aged 27, eight weeks pregnant, was admitted to the Hull Royal Infirmary on November 4th, 1923. Her last period had been on September 7th. She had been vomiting for three weeks, first after breakfast, then after every meal, then all day, and latterly all night, at short intervals. On the date mentioned she had been vomiting every half hour. The vomit was green, contained mucus, and some specimens digested blood also. The pulse was 88, temperature 99.6°, heart and lungs normal, abdomen rather retracted, nothing abnormal was felt. The tongue was clean. On vaginal examination the os uteri was found soft and enlarged, consistent with two months pregnancy. Urine: specific gravity 1030, acid, no albumin, no blood, no pus, no bile, no diacetic acid or acetone present. The blood was examined by Dr. Adamson, honorary pathologist, for the blood sugar content, which was found to be normal (0.085). The patient was very exhausted and was suffering from lack of sleep, not having slept for two or three nights, owing to the almost continuous vomiting.

Treatment was started at 3 p.m. on November 4th by gastric lavage with sodium bicarborate solution (1 drachm to the pint), one or two pints being used. Rectal salines with half an ounce each of sodium bicarbonate and glucose to the pint were administered 1 pint every four hours. Solution of adrenaline 5 minims hypodermically was ordered every three hours for four doses or until the vomiting ceased. She was not to be awakened for the rectal saline. The end of the bed was raised by putting blocks under the lower end. A hypodermic injection of morphine 1/6 grain was given at 8.15 p.m.

On November 5th she was ordered 5 minims of the adrenaline solution every six hours and rectal salines with no sodium bicarbonate but with glucose every four hours. Water was given by the mouth in small feeds at 10 a.m. gastric lavage with saline solution and sodium bicarbonate 1 drachm to the pint, followed by saline solution only. Water was given at first in 1 drachm feeds every half hour or hour and slowly increased. The rectal salines were continued every four hours with 1 oz. of glucose and 2 drachms of sodium bicarbonate added to the 4 p.m. rectal saline. To the 6 p.m. and 10 p.m. salines 30 grains and 20 grains respectively of potassium bromide were added.

She vomited three times in the night, but the vomit was no longer bile-stained. Gastric lavage was performed at 10 a.m. on November 6th, and feeds of water increased to 2 oz. every two hours. On November 7th she was kept on water 5 oz. every two hours, and rectal injections every six hours with sodium bicarbonate. Glucose was then added to the water by mouth in the proportion of half an ounce to half a pint. On November 8th and 9th the same procedure was followed, and the vomiting stopped. On November 10th jelly was given, and on the 11th thin Benger's food, on the 12th there was slight vomiting after the Benger's food, but not otherwise. On November 13th beef tea and bread crumbs were given as well as weak tea and condensed milk. On the 15th there was a slight quantity of acetone in the urine, but this disappeared on the 16th, and she was put on fish, eggs, etc. On November 20th she was given lactogen as breast milk was deficient, and on the 23rd she was given chicken. The vomiting stopped on November 8th, four days after admission, except on one or two occasions when she had slight vomiting on increasing the diet.

In any case of severe vomiting in a pregnant woman such conditions as gastric ulcer, or other gastric disease, cirrhosis of the liver, cerebral tumour, pernicious anaemia, phthisis, etc., must be excluded. It is possible that there may be a combination of causes, or that the principal cause is aggravated by others. Assuming that the chief cause is lack of glycogen in the liver, due to a short period of starvation which lowers the glycogen content of the liver, vomiting may be accelerated if the patient is of a neurotic type, or if there is a relative toxaemia of the bowel, due to constipation. The treatment of such condition can be carried out by putting the patient on frequent small meals.

Summary of Treatment

The essentials of treatment in cases of pernicious vomiting in pregnancy should be:

1. Rest in bed.
2. Gastric lavage, with solution of sodium bicarbonate 1 drachm to the pint, one or two pints being used.
3. Solution of adrenaline, 5 minims hypodermically every three hours for a few doses until the vomiting ceases, or the adrenaline solution may be given by the mouth in doses of 10 to 20 minims in a little water. It will be found that this drug is very efficient in stopping many kinds of vomiting.
4. The omission of all feeding by the mouth at first, and feeding by rectal salines containing from half an ounce upwards of glucose to the pint, with a small quantity of sodium bicarbonate added if there is any diacetic acid in the urine.
5. The addition to the evening salines of 30 grains of potassium bromide to help sleep and reduce irritability of the nervous system.
6. The gradual increase in feeding by the mouth, beginning with small feeds of water as described above.

In cases of vomiting of pregnancy which are seen by the physician as they are getting more severe it will be found that treatment by administration by the mouth or solution of adrenaline in doses of 10 minims or 1 in 1,000 solution added to 2 drachms of water at three to six hourly intervals, will in many cases be sufficient to stop the vomiting. The diet at the same time should be light and given at short intervals. The above treatment by lavage and rectal salines should be reserved for the more serious cases, or to those which do not respond to treatment by adrenaline.

PNEUMOCOCCAL POLYARTHRITIS

BY

ALFRED S. GUBB, M.D. PARIS,

PHYSICIAN TO THE BRITISH COTTAGE HOSPITAL, ALGIERS

In view of the grave plight on admission, and for some time after, of the patient whose case is here related, and in view also of the fact that treatment was limited to the subcutaneous injection of antipneumococcal serum, the rapid improvement in the general health and the arrest of the tendency to suppuration of the joints must apparently be credited to the curative effects of the serum. The immediate effect of the treatment was evidently to kill off the colonies of pneumococci originally present in the synovial effusion in such wise that on a second examination of the fluid no pneumococci were present.

On March 5th a [illegible] engineer was sent to the hospital with a [illegible]. He stated that three days after [illegible] he had an attack of diarrhoea which lasted about a fortnight. He had as many as twelve motions in the twenty-four hours; they were scanty and sometimes blood-stained. He lost much weight. Three weeks after cessation of the diarrhoea the left knee began to swell and caused sufficient pain to prevent sleep. That was when he was seen four days before admission.

On admission his left knee was much enlarged, owing apparently to thickening of the periarticular structures. Little or no fluctuation could be made out over the joint. Movement was extremely limited and very painful. The ankle and dorsum of the foot on that side were oedematous. The temperature was 100.8° F., the pulse 130. The heart and lungs were healthy; the spleen was not enlarged. He was thin, but thought he was only incipient had fallen ill. He said he had had a urethral discharge some weeks previously, but on discussing the matter with him there did not appear to be any valid ground for suspecting gonorrhoea. In any case the urethral mucosa was normal in appearance; there was no undue moisture, and no trace of the gonococcus could be discovered on bacteriological examination.

Extension applied to the limb by means of weights afforded the patient great relief. As there was a possibility, however remote, of a gonococcal origin, he was given three injections of a product known as neo-dmegon (an antigonococcal vaccine), whereupon the temperature, which had fallen to normal, rose; the patient had been resting in bed again for a time to 100°.

During the next few days he lost ground. There was atrophy of the thigh muscles, more marked on the left side. He had no

appetite, he complained of night-sweats and was rapidly losing flesh On March 17th the right knee was swollen and soon became greatly distended, and there was pronounced fluctuation The swelling was not accompanied by pain Salicylates, 4 grams a day, had no effect

On March 20th I asked our surgeon, Dr Pelissier, to see the patient with me On his advice the left knee was punctured and some pale yellow fluid withdrawn by aspiration It contained numerous flakes, pointing to the imminence of suppuration Dr Lemaire reported that it contained 95 per cent polynuclear leucocytes, staining well (no karyolysis), and very numerous pneumococci, intra and extra cellular No tubercle bacilli were present The urine, at first faintly acid, later on became neutral, no albumin was present On March 23rd the patient complained of his right elbow, which was beginning to swell It was not thought desirable to perform arthrotomy of the knee joint, Dr Pelissier being of opinion that in suppuration due to the pneumococcus operative measures should be had recourse to as late as possible

In view of the bacteriological report we gave him daily injections of Dr Minet's antipneumococcal vaccine together with 20 c cm of the antipneumococcal vaccine prepared by the Pasteur Institute No vaccine was given on March 25th and 26th, but the daily dose of serum was raised to 40 c cm This was injected under the skin on the outer aspect of the thighs

On March 30th the right knee was again punctured and some fluid withdrawn This time it was quite clear and free from flakes The bacteriological report was to the effect that no pneumococci were present

Between March 27th and April 2nd the patient was given a daily dose of 20 c cm of the serum, but in spite of the administration of calcium chloride and adrenaline he suffered a good deal from serum reaction urticaria, arthralgia in all the joints, especially in the shoulders, hard oedema where the serum had been injected, and so on

At this stage it could be seen that the swelling of the knees was diminishing and the patient's general health improving The appetite was returning, he was in better spirits, and was feeling more comfortable apart from the serum manifestations The temperature had returned to normal and remained there, he was putting on weight, and by the middle of April he was able to get up and walk a little, though he felt very weak on his legs He was ordered massage and passive movements, and the stiffness of the joints gradually lessened

His pulse remained very rapid (130), though the heart sounds and cardiac rhythm were normal Blood pressure 125 maximum, 90 minimum The tachycardia was greatly influenced by tobacco, so that though he only smoked in moderation he was advised to drop it for the time being Thereupon the pulse fell to 90 The feet and legs became very oedematous towards evening He was discharged for the return journey to England on May 22nd

I am sorry it did not occur to me to have recourse to haemoculture, which might have afforded interesting information In another case of the kind I should feel disposed to inject some serum into the inflamed articulations, though in this particular instance no time was lost in consequence of our not having done so, inasmuch as the joint trouble began to improve directly we started injecting the serum Even so, the case presents considerable interest in view of its differentiation from gonorrhoeal arthritis on the one hand and from tuberculous arthritis on the other On a correct diagnosis depended the success of the treatment

Judging from statistics of polyarticular pneumococcal arthritis, the case would in all probability have had a fatal termination but for the bacteriological diagnosis, hence the importance of such examinations in all cases of arthritis not obviously rheumatic in origin—that is to say, cases in which the patient's antecedents are confirmed by the action of the salicylates

Pneumococcal arthritis, though not very common, has been recognized for many years In most instances it is secondary to pneumonia, but it also occurs independently of any other pneumococcal lesion, and arthritis in patients suffering from pneumonia is not necessarily due to the pneumococcus It is met with most frequently in children Dr Gasne[1] reports 52 cases of pneumococcal arthritis—33 during the first twelve months of life, 8 between 1 and 2, 8 between 2 and 7, and 3 between 7 and 15 In 35 the affection was monarticular and in 17 polyarticular, the bigger joints being mostly attacked Death occurred in 16 of the 52 cases

Bulkley[2] collected 173 cases, mostly in children In 70 per cent it was associated with pneumonia Three-quarters of the cases were monarticular (83 times the knee, 41 the shoulder, 23 the hip, 22 the wrist, 20 the ankle, 18 the elbow, and 12 the sterno-clavicular articulation) Suppuration took place in 147 of the cases, while in 15 the effusion was serous

ACUTE POISONING BY FUMES FROM CELLULOSE ACETATE

BY

GODFREY CARTER, M B VICT, M R C P ED,

LECTURER IN FORENSIC MEDICINE, UNIVERSITY OF SHEFFIELD

DURING the late war many chemical substances were produced, or brought into industrial use, almost for the first time, as belligerent necessities arose Some were found to possess highly toxic properties which, little suspected at the outset, proved to be the cause of many cases of grave illness, prolonged ill health, and even, in some instances, death Among them I would name trinitrotoluene and cellulose acetate The latter is extensively used as a varnish for aeroplane wings It is a mixture of benzine, acetone, methylated alcohol, and tetrachlorethane, forming a colourless liquid which gives off a heavy pear-like odour

Sir William Willcox first drew attention to the connexion between many cases of serious icteric illness and the use of cellulose acetate in some of the large aeroplane factories, The results of his investigations, both clinical and chemical, were published in 1915 He found that after the early symptoms of headache, vomiting, and debility had become established, jaundice supervened *Post-mortem* examination in fatal cases revealed an acute toxic hepatitis closely resembling acute yellow atrophy With this was associated parenchymatous degeneration of the kidneys He added that the tetrachlorethane alone, in addition to being a tissue poison, is a narcotic 2 8 times as powerful as chloroform

Since the danger has been appreciated fewer cases of cellulose poisoning have occurred, owing to the special precautions now exercised in aeroplane factories But quite recently a communication was published advising the use of this cellulose acetate for making encasing splints for limbs and joints, etc As a result of this publication a doctor in this neighbourhood put up a child's knee in a splint of this construction I am indebted to him for the full particulars given below as regards the serious poisoning which followed I was asked to see the child in consultation about 8 p m , when, I am glad to state, consciousness was slowly returning The patient presented the appearance of just coming round from a general anaesthetic

The patient was a female, aged 3½ years, with disease of the right knee joint On July 7th, 1924, at 11 a m , cellulose acetate (solutions Nos 25 and 26) was applied to the right leg by the technique advised by Dr Fernandez Half an hour later the patient was returned to bed and ate a good dinner The leg was propped up and exposed to the air, the patient lying on her back She was placed in the open air ward At 3 p m she vomited and she continued to vomit every few minutes until 11 30 Shortly after she began to vomit she became cyanosed (lips and cheeks) Pulse 136 feeble, at times hardly perceptible, respirations shallow, average 36, temperature 96°

At 4 o'clock she became unconscious The splint was removed and the cyanosis was replaced by pallor At 1 30 1½ pints of saline with sodium bicarbonate were given by the rectum most of it was retained At 5 o'clock the temperature was 98° the pulse had improved—still rapid, but stronger her colour had improved lips red She was still unconscious, with large equal pupils which did not react to light Her breath smelt strongly of acetone At 6 o'clock the bowels acted—stool normal general condition unchanged At 7 30 consciousness began slowly to return, she complained of headache Temperature 99° pulse 136 respirations 36 At 11 30 the patient appeared to be much better, he vomited slightly and then went to sleep, and slept all night

On July 8th, at 10 a m , the patient appeared to be almost normal temperature 98 4°, pulse 120, respirations 30 The pupils were normal and reacted to light The skin of the leg was red, inflamed, and blistered over the area covered by the cellulose acetate solution, this in spite of the fact that before applying on the skin was covered with a layer of vaseline an eighth of an inch thick, before being covered with layers of wadding, on top of which the solution was applied in layers or bandage At 5 p m examination of the urine showed a sediment of ur tes specific gravity 1020, acid colour normal, no albumin a considerable amount of acetone, no diacetic acid, no sugar, no blood

Fourteen days after the above narrated incident the patient showed no signs of jaundice or other complication But I think it is well that these facts should be brought to the notice of the profession as a warning against the use of this preparation It nearly caused a catastrophe of a particularly distressing nature

British Medical Association

PROCEEDINGS OF SECTIONS AT THE ANNUAL MEETING, BRADFORD, 1924

SECTION OF DERMATOLOGY

J M H MACLEOD, M D, F R C P, President.

PRESIDENT'S OPENING REMARKS

THE PRESIDENT, in opening the proceedings on July 23rd, said I am deeply sensible of the honour conferred upon me by the Council in inviting me to preside over the meeting of this Section, but in accepting it I could not but feel weighed down by the burden of the responsibilities attached to the office To some extent these have been mitigated, as I have received from the head office a memorandum for officers of Sections, in which it is clearly stated that the President of a Section is not expected to give an address—a regulation to which I gladly conform Before opening the proceedings I should like to remind you that the last time there was a Section of Dermatology was at the meeting in Glasgow in 1922, and that since then we are the poorer by the loss of three distinguished colleagues, active members of this Association, and former Presidents of this Section—namely, Sir James Galloway, Dr J J Pringle, and Sir Malcolm Morris, men who spent their lives in the service of their fellows, and who did so much to advance our knowledge of skin diseases and to establish dermatology as an important branch of medicine The programme for this meeting has been drawn up with considerable care by your officers, the subjects chosen for discussion being of special interest at the moment, not only to dermatologists but to the whole profession These discussions the group of interesting papers which we have been fortunate in obtaining, and the demonstration of cases, will fully occupy our time I hope all of you will combine with me in making our meeting a pleasure and a success, and that you will take part in the discussions, not so much in a formal way as in a spirit of friendly criticism and good fellowship

DISCUSSION ON THE CANCEROUS AND PRECANCEROUS CONDITIONS OF THE SKIN

OPENING PAPERS

I—H MACCORMAC, C B E, M D, F R C P,
Physician for Diseases of the Skin Middlesex Hospital, Physician St John's Hospital, Leicester Square

THE exact pathology of the malignant growth generally called rodent ulcer, and its relationship to squamous-cell carcinoma, has given rise to a considerable literature and provoked much discussion The majority of dermatologists favour the view that the two forms of growth are distinct and separate varieties of cancer, and, although they may not be in complete agreement as to the mode of origin of each type of neoplasm, the hypothesis most generally accepted is that the one arises from the basal, the other from the prickle-cell, layer of the epidermis

There are many facts to be obtained from the study of these two apparently dissimilar types of new formation which can be used to throw doubt upon the truth of this doctrine and it will be the object of this paper to show that baso-cellular and spino-cellular epitheliomata are identical the rate of growth governing the type of cell formed Or the hypothesis may be expressed in a different way as follows where the growth is slow small cells resembling those of the basal layer are produced and where more rapid, there result large cells with more abundant cytoplasm having an appearance similar to those of the prickle cell group

It should particularly be noted that this statement refers to the common primary carcinomata of the skin, and expressly excludes the similar new growths arising in mucous or semi-mucous membranes, because, as will be pointed out later, the malignancy of mucous membrane growths is relatively much greater It would appear, indeed, that the reputation of the prickle-cell group depends upon the inclusion within it of the carcinomata arising on mucous membranes—a type, indeed, with similar histological features, but differing widely in its clinical course

Jacob,[1] a Dublin surgeon, was the first investigator to call attention to the condition we now name rodent ulcer In his paper he stated that the characteristic features of the disease were its extraordinary slowness of progress, the peculiar character of the surface and edges of the ulcer, the comparatively inconsiderable suffering caused by it, its incurable nature except by extirpation, and the fact that contamination of lymphatic glands was not found He further asserted that it was not a genuine form of cancer The views expressed in this original paper came in time to be commonly accepted as the standard opinion of dermatologists in this country

In seeking to prove the identical nature of the basal- and prickle-cell growths it is not necessary to deal specifically with all the characters adverted to by Jacob Certain of them, with other accepted attributes of this form of disease subsequently added by various observers, demand special consideration These several points may be considered under headings as follow

1 That rodent ulcer is usually confined to the face

This statement will still be accepted in its general form It is of some importance to notice that exceptions are met with on practically every part of the cutaneous covering of the body Their existence disproves theories put forward to explain the origin of the growth in certain embryonic structures or along the distribution of particular nerves

2 That rodent ulcer begins at an earlier age than other forms of cancer

This assertion, made on the authority of Dubreuilh and Auche,[2] would, if it were true, succeed in placing the new growth in a special category, and by this feature separate it from all other forms of cancer The statement is not absolutely true, as the following facts will show Thus in 39 cases of rodent cancer an estimate could be made of the age at which the disease commenced, and this was found to give an average of 53 7 years[3] The average age incidence in a large number of cases of cancer of the breast studied by Beckton was identical—namely, 53 7 years[4] For the cervix 46 15 years was determined (MacCormac[5]), and for the rectum 52 years (Colwell and Woodman[6]) These figures represent the results of statistical investigations based upon material in the cancer department of the Middlesex Hospital, and may be accepted as reasonably accurate They dispose of the assertion of Dubreuilh and Auche, and further show that rodent ulcer in respect of its age incidence corresponds to cancer in general in being a disease of individuals past middle life

If comparison be made with the age of incidence of the rodent or basal and the prickle-cell type of epithelioma when it affects the skin, it will be found that they are in close agreement In 21 cases of the latter the average age of onset was found to be 51 5 years This lies within the range of 53 7 years, the figure arrived at in the series of cases of the rodent type quoted above

3 That in rodent ulcer glandular and visceral metastases do not occur

It is important to examine the exact bearing of this statement on the subject under discussion It is, in the first place, only relatively true, for proved exceptions have been recorded in medical literature The following three may be quoted

C F Peadles's Case[7]

The patient a man aged 46 years presented a rodent ulcer of fifteen years duration affecting the right lower eyelid The margin of the growth was hard and livid partial cicatrization of the central part had taken place The ocular conjunctiva remained healthy A round nodule the size of a hazel nut was found at the anterior edge of the sterno-mastoid muscle on the right side

The primary disease finally began to make rapid progress, and the patient died of septic pneumonia following a haemorrhage from the growth The autopsy showed a large ulcer extending widely into the tissues Under the microscope both primary growth and the cervical nodule presented the appearances typical of rodent ulcer

Fordyce's Case [8]

An example of multiple tumours of the basal cell type arising on psoriatic patches The patient subsequently developed metastases in the mediastinal glands and internal organs and died of carcinosis The tumours were made of small deeply staining cells with scant stroma and numerous foci of degeneration

The following, taken from the Middlesex Hospital, may also be quoted in this connexion The patient, a woman aged 63 years, developed an "ulcer" on the back of the neck, gradually increasing in size during fifteen years and extending both laterally and deeply X rays had been used in treatment during a period of sixteen months At the *post mortem* examination there was found, in addition to the primary growth, a nodule the size of a walnut on the lower surface of the right lobe of the liver Microscopically the growth, both primary and secondary, was of the indeterminate type, one where it is difficult to decide whether the classification should be basal or prickle It was certainly not a variety of x ray cancer, and in its clinical and microscopical features came within the "rodent" group

These cases, or at least the first and second, may be taken as proof that in certain circumstances growths of the rodent type are capable of forming metastases The fact that they rarely do so is, however, no sufficient proof that basal-cell carcinoma is essentially different from the prickle type If we accept the argument that the basal is only a slowly growing, and therefore relatively a less malignant, form of cancer, then we would expect less chance of dissemination, as is in fact the case The basal and prickle can thus be regarded as each occupying positions at the end of a scale between which intermediate stages exist, with corresponding clinical and histological characters Nor, indeed, contrary to the general belief, do prickle-cell cancers of the skin readily form metastases, as an examination of the following series—from which all mucous membrane lesions have been excluded—will demonstrate [9] They consist of 22 cases with a distribution as follows

Cheek	6 cases	Neck	1 case
Eyelid	3 ,,	Thumb	1 ,,
Nose	2 ,,	Finger	1 ,,
Temple	2 ,,	Abdomen	1 ,,
Leg	3 ,,	Vulva	1 ,,
Brow	1 case		

Enlargement of lymphatic glands implying metastases was noted in 6 instances only, in 3 of which microscopic examination was made All were free from malignant deposit, one being tuberculosis Four of these 22 cases arose on patches of lupus vulgaris, and may have been, but were not necessarily, examples of x-ray cancer

E S, aged 64 The growth began on the left lower eyelid, was operated upon and recurred, gradually forming a considerable cavity Microscopically the primary growth was a typical prickle-cell carcinoma At the *post mortem* examination an enlarged lymphatic gland was found in the posterior triangle showing, under the microscope, giant cells and the general structure of tuberculosis There were no metastases

E S, aged 65 A small "wart" formed on the abdomen, growing for seven years, eventually assuming the character of a rather foul ulcer the size of a two shilling piece An enlarged gland was present in the groin The microscope demonstrated that the primary growth was a prickle cell carcinoma, and that the gland was quite free from deposit

P J P, aged 55 An ulcer on right leg for sixteen months, bitterly painful, in the groin there were enlarged glands Microscopically the ulcer was found to be malignant and of the prickle cell type, and the glands quite free from contamination

The series of 22 cases shows that glandular metastasis is by no means common in prickle-cell cancer of the skin It is important to lay some stress upon this, because one of the chief distinctions drawn between basal- and prickle-cell growths is that the one (basal) never involves glands, while the other (prickle) frequently does

Cancer of the skin of the abdomen is fairly often encountered in Kashmir as the result of kangri burns—a condition to which Neve [9] has drawn special attention He states that glandular metastases are seen, especially in ulcerating types, but it is not clear from his accounts that microscopic examinations have been made to exclude inflammatory enlargement, a common source of error There are also the well known examples of x-ray cancer with their tragic results But even these exceptions, if admitted, do not disprove the general truth of the assertion that metastases are rare in both forms of primary cutaneous carcinoma In this connexion it is curious to observe that dermatologists, when writing on the subject, generally illustrate the malignancy and liability to form metastatic deposit in prickle-cell cancer by examples taken from the condition when arising in a mucous membrane, as an examination of almost any textbook will show This high grade of malignancy of the mucous membrane growths is to be explained on the vascularity of the structure in which they arise, the growth being better nourished and better supplied with the means of dissemination In some degree such precancerous conditions as x-ray dermatitis partake of this increased vascularity, which may account for their greater activity

An interesting paper has been contributed on the subject of occupational dermatoses of the paraffin workers of the Scottish shale oil industry by Dr Alexander Scott [10] He says, in treating of epitheliomata, that the lymphatic glands do not become involved until a late stage, but that this varies according to the situation of the original growth No figures, however, are given to prove this assertion or to show what proportion of the enlarged glands are inflammatory Further on a statement is made by the author that, in cases terminating fatally, death is as a rule due to extensive ulceration with exhaustion rather than to metastases—an assertion that is in accord with the views advanced here

It might be expected that this subject would be illuminated by the experimental study of the so called tar cancers in mice, but an examination of the literature on the subject will show that, although metastases are recorded, this aspect of the subject, as regards the relative incidence, is not very fully dealt with, and further, it will be observed that some of the neoplasms classified as carcinomata may be sarcomata, and, in any case where a carcinoma is produced there is a chance of a sarcoma also arising through the same agency From an issue at present so confused no definite conclusions should be drawn

HISTOLOGY OF RODENT ULCER

As the study of the histology of rodent ulcer has taken so prominent a part in the investigation of this disease, it is necessary to consider the subject in some detail Writing in 1910, I classified the types of growth met with as pure rodent ulcers, mixed rodent ulcers, and an indeterminate type

Pure rodent ulcer includes the majority of cases and represents the ordinary conception of the disease In it masses of malignant cells of the small type are seen arranged in islands or trabeculae, sharply demarcated from the neighbouring connective tissue At the edge of the growth there is usually found a row of columnar cells one or two deep Mitotic figures may often be observed in the border, but are rarely met with in the main part of the growth The appearance of a capsule of flattened connective tissue cells is frequent, and occasionally flattened—presumably malignant—cells occur within the boundary formed by the columnar cells Cysts are rare, but may occur within the growth Of 16 cases examined, ill developed cell-nests were observed in 3 In the neighbourhood of the new growth there is present a dense plasma cell infiltration and the sebaceous glands show evidence of activity

Into the indeterminate type fall certain rare growths where great difficulty is experienced in determining whether the neoplasm should be classified with the basal- or prickle cell variety

Mixed Rodent Ulcer.—In this group, a very important one, there are found, side by side and merging into one another, growths of the basal- and prickle cell types This combination was encountered three times out of 16 cases, and is therefore not uncommon In two the basal- and prickle-cell growths seemed to be distinct, but in the third the arrangement was different Sections of this growth showed a surface epithelium, beneath which there was seen a growth of the ordinary rodent type, and then, placed more deeply, a typical prickle-cell carcinoma, in many places it was easy to observe the transition of the one into the other, seemingly direct proof of the single nature of the prickle- and basal-cell groups

The division of rodent ulcer into these groups is of more than academic interest it has a bearing on the subject under discussion and it has also a practical application The practical application lies in its relation to treatment, since we know by experience that the prognosis in rodent ulcer is good, for there the cells have assumed this form because of their slow growth and therefore relatively low degree of malignancy Such cells are naturally more readily influenced by x rays, and even more surely by radium, as compared with the more active and so-called spino cellular type, where such measures may even cause aggravation

In a paper communicated to the Dermatological Section of the Royal Society of Medicine in 1922 on the primary new growths of the skin, Darier classified them under the three following heads (1) spino-cellular group (2) baso-cellular group or rodent ulcer, and (3) metatypic or spino-baso cellular epithelíomata, further subdivided by him into mixed and intermediate forms [11] This classification seems to be similar to that made by me, Darier's metatypic group corresponding to the mixed and indeterminate types

Commenting on the spino cellular growths, Darier observes that they form the most common (50 per cent) and most malignant species, and that they are observed chiefly in the mouth, but also on the face, ears, body generally, and on cicatrices, ulcers, and lupus vulgaris While Darier's facts are undoubtedly right, as he expresses them, they are so because he includes within his group the malignant growths of the mouth But such are not cancer of the skin, and follow an entirely different clinical course Where they are included with cancer of the skin, there is produced a false estimate of the degree of malignancy of the latter

Many dermatologists believe that the presence or absence of epidermic fibrils—those delicate processes seen most characteristically uniting the cells of the rete mucosum—may be used first to distinguish from each other the primary carcinomata of the skin, and secondly, to show, where they are present that the growth has its origin in the prickle cell layer and, when absent, in the basal cell layer

While it is generally asserted that these fibrils are absent from the basal layer in man, it would seem that this assertion is not entirely true Thompson [12] who has paid special attention to the point, concludes from his studies that prickles are found in the basal layer in certain animals although not very distinct under normal conditions He also states that they may be found in the basal cell layer of human skin under conditions of increased cell activity

When investigating this question I examined 14 separate cases of rodent ulcer, staining the sections for fibrils by the Unna-Kromayer method As this process is somewhat uncertain, no conclusions were drawn in any case unless prickles could be seen in the normal portion of the epidermis, thus demonstrating that the stain had acted effectively I found, contrary to the general opinion, that prickles were often clearly seen between the cells of the basal layer in normal skin In only one instance could I detect true fibrillae between the cells of a rodent ulcer growth This was clinically a typical example of rodent ulcer of nine years' duration, situated in the neighbourhood of the left lower eyelid, microscopically it showed the characteristic features of this variety of tumour

It would thus appear that the deductions drawn from the absence or presence of prickles are fallacious, and it is interesting to note in this connexion that Dubreuilh and Auche go so far as to state that prickles are often present in rodent ulcer It should perhaps be pointed out that what has been said above refers to true prickle cells without considering the irregular processes often seen between neighbouring cells, in appearance quite distinct from the genuine sheaves These false prickles may obviously occur as the result of cell shrinkage in the preparation of the specimen

An apparent spontaneous origin characterizes the rodent ulcer type of growth—that is to say, it usually appears on an area of skin where no pre-existing abnormal state has been detected That the prickle cell type can also arise in a similar manner is shown in forms clinically indistinguishable from rodent ulcer It is recognized however, that there are a number of what may be termed precancerous conditions, because they predispose the tissues to a malignant degeneration They include among others, chronic ulcer, lupus vulgaris, keratosis, scars, and x ray dermatitis It is a matter of common observation that the form of growth associated with them generally assumes the prickle-cell type Some have held that a relationship exists between syphilis and cancer of the skin a view that does not appear to have any support in clinical or pathological investigation

Where cancer arises on a mucous membrane, syphilis does appear to have been a direct causal factor, as the following will show Morson and I investigated the history and Wassermann reaction in 137 cases of carcinoma of various regions of the body, and we obtained evidence of previous syphilis in 21 instances, or 15 3 per cent [13]

When these figures were further analysed it was found that the largest proportion of cases occurred in connexion with the mouth region, particularly the tongue Thus, in 23 cases of cancer of the tongue we found evidence of syphilis in 6, in the lip, 1 out of 5, in the floor of the mouth, 2 out of 7, in the fauces 1 in 3 Altogether, out of a total of 46 cases of carcinoma of the mouth region, evidence of previous syphilis was obtained in 10, making a percentage of 21 7 In the case of the tongue alone, as will be seen above the percentage reached 26 08, or more than a quarter of the total number examined A series of 13 cases of carcinoma of the cervix uteri was also examined, of these, in two instances we obtained evidence of previous syphilitic infection, making a total of 15 4 per cent The number is too small to allow of any definite conclusion, but at least it suggests that in this variety of malignant disease specific infection may play some not unimportant part

The study of malignant disease as it affects the mucous membrane of the cervix throws some additional light on the subject under consideration An investigation into all such cases admitted into the general or cancer wards of the Middlesex Hospital during the quinquennium 1904-8 gave the following facts [6] Out of 241 cases a *post mortem* examination had been made in 107 Of this number, in only 48, or 44 85 per cent, was any malignant deposit present in glands or viscera, it should be noted that these findings were confirmed by subsequent microscopic examination It might seem that this has no direct bearing on the subject of rodent cancer, but, as all who have had occasion to examine the microscopic appearances in carcinoma of the cervix will know, there is at times found a distinct resemblance to the basal cell cutaneous growths, and in most cases in some part at least of the section masses of cells of the small rodent form will be met with From what has been said this should indicate a lesser degree of malignancy, *an observation confirmed by the statistical record*

Primary epithelioma may arise in three situations—the skin, the semi mucous membranes, such as the lip, and the true mucous membranes, as the tongue On a semi mucous membrane the degree of malignancy is greater than on the skin, and higher again when the disease originates on, or spreads to, a mucous membrane It is unfortunate, therefore, that in most cases where observations are made, a distinction is not drawn between these various clinical types

An examination of the data recorded above seems to point to the fact that there is but one form of primary carcinoma of the skin, assuming the basal type when growing slowly and the prickle when in a more active phase it is at times, indeed, impossible to distinguish one from the other except by the microscope Nor does the presence or absence of demonstrable prickle cells serve to create two types of growth as has been alleged Perhaps the most convincing evidence of the single nature of the two varieties is to be obtained from an examination of the mixed type, where both can be seen together merging one into the other The clinical aspects of epithelioma, it is asserted, depend more upon their anatomical position than their histological type, and this is true even for the pure cutaneous growths, for there seems to be a clinical distinction between those arising about the scrotum and those elsewhere situated

Two further observations may be made First, that nothing that has been said should be taken as having reference to the melanotic growths Secondly, that, although the terms "prickle" and "basal" have been employed throughout, this is not intended to commit the writer to any opinions as to the nature of the growth these terms are merely returned as being a convenient form of nomenclature

II.—LOUIS SAVATARD, L.S.A.,

Honorary Physician, Manchester and Salford Skin Hospital

LIKE Dr MacCormac, I, too, had the good fortune in the days of my youth of being brought into intimate contact with cancer research Some five-and-twenty years ago I was appointed clinical assistant to the Manchester Cancer Hospital, and there, under the able guidance of the late Professor Delepine and Professor Wild, I was encouraged in my work from both the pathological and clinical points of view Later, under the stimulating influence of that brilliant dermatologist, the late Dr H A G Brooke, my teacher, colleague, and friend, I learnt to search the scriptures of dermatology and to prove all things

Carcinomata of the skin may be divided into primary and secondary, primary growths arising in the skin itself and secondary growths being metastatic tumours of primary carcinomata elsewhere

Primary growths may on histological and clinical grounds be classified as (1) Squamous (2) Basal (3) Mixed—(*a*) MacCormac-Darier type, (*b*) squamo-basal, (*c*) transitional (4) Naevo-carcinomata

1 *Squamous Cancer*

This may arise (*a*) on apparently normal skin, (*b*) on dermatoses which cannot be considered as precancerous, (*c*) on dermatoses which not infrequently become cancerous and are consequently spoken of as precancerous conditions of the skin

The new growths arising on apparently normal skin may be of interfollicular or of follicular origin They may be slowly or rapidly malignant, their malignancy often being dependent on their situation The early epithelioma, which may be recognized when it is only the size of a small pin's head and of only a few days' duration, cannot with certainty be clinically distinguished from less malignant growths, nor can we foretell at this period how malignant the tumour may become, but the squamous carcinoma of two to three weeks' duration, when it may have attained the size of a pea, should be recognizable clinically It is true that at this stage, and even at a much later stage, the lymphatic glands are not invaded, and this useful guide to differential diagnosis, on which (as Dr MacCormac states, and to which I have elsewhere drawn attention) the textbooks lay far too much emphasis, is of little practical use It is, however, of the utmost importance that medical men if they are to prevent some of their patients suffering untold agony ought to be acquainted, not only with the inoperable cancer so frequently paraded in textbooks, but with the initial lesion, the removal of which should be within the scope of the general medical practitioner

The early epithelioma is the same colour as the skin, raised above the skin's surface, and it has a translucent appearance Small blood vessels may be seen coursing over its edge and its centre is often apparently plugged The tumour at this stage is usually fairly hard and infiltrates the true skin It simulates an early basal-cell carcinoma and is frequently mistaken for one, but this error should not arise when the rate of growth is considered, for an uncomplicated basal-cell growth as a rule takes two years to attain the size of a squamous-cell growth of two weeks (the exceptions I will mention later) It is not possible by ordinary pressure to extrude the "core" of the tumour, and so we can differentiate it from an epithelioma contagiosum The absence of inflammatory signs should prevent its being diagnosed as a boil—a not uncommon mistake With ordinary care we ought to be able to differentiate it from a sebaceous cyst, though its translucency has in some instances led to this error in diagnosis Not infrequently it is stated that the cancer was preceded by a wart, pimple, scab, ulcer, crack wen, blister, or lump As a matter of fact these apparently benign lesions are frequently the initial stages of the new growth and not precursors of the cancer

In dermatological practice the primary squamous-cell carcinoma is most frequently seen on the face, as also is the basal-cell carcinoma, but the epithelioma is not infrequently met with on the extremities and on the genital organs The lower lip and upper lid are frequently invaded by the squamous and rarely by the basal type, the bridge and tip of the nose are relatively more frequently the sites of epithelioma than of the "rodent" ulcer, the scalp is rarely affected by either *With regard to the age incidence of (a) scar epithelioma, (b) basal cell growths, (c) primary squamous-cell growths*—the age being the age of the patient when the tumour was first evident—in one hundred cases of epithelioma of the face, and one thousand cases of basal-cell tumours of the face, the youngest patient in each condition was 17 years old The basal curve reached its maximum at the 45th year, the squamous curve at the 65th year, almost as many basal growths began between 17 and 45 as between 45 and 80, squamous growths were frequently seen in young adults, and the scar cancer was a malignant growth of comparatively early age, was related to the age of the scar, and was independent of the age of the patient I have referred to this precancerous condition here for convenience, but will mention it again later You will see that my conclusions confirm those of the opener, though they are based on a far larger number of cases If I may venture any criticism of Dr MacCormac's statistics, it is that his numbers are rather too few on which to base reliable conclusions We ought, I think, to work with hundreds rather than with dozens

These early lesions were all excised and the diagnosis confirmed histologically Some few years ago I found it difficult to get my clinical diagnosis always accepted when I showed the cases at our local Dermatological Society, and so provided sections Now, however, these early cases are being more often seen because they are more frequently recognized It is, I think, true that we in Manchester and Lancashire see a relatively large number of cases of skin cancer, and I shall endeavour to account for this later In none of these cases were the lymphatic glands affected, and there were no recurrences after excision Dr MacCormac has referred to the comparative benignity of many squamous cancers of the skin I am in entire agreement with him, and for this reason—that dermatologists usually see the earlier lesions, whilst the later lesions with glandular involvement come under the observation of the surgeon In two fairly advanced cases, one showed no evidence of metastases, the other, though clinically not suggestive of any greater malignancy, soon developed malignant invasion of the pre-auricular gland

Visceral metastatic growths are only occasionally met with Nevertheless, I am of the opinion that the squamous cancer should be differentiated from the basal and other mixed forms of cancer, because its potential malignancy can never be foretold

2 *Basal Cancer*

Basal cancer may appear (*a*) on apparently normal skin, (*b*) on dermatoses which cannot be considered as precancerous, (*c*) on dermatoses which may be considered as precancerous They may be solitary or multiple They are most frequently seen on the face and often overlooked on

the trunk though latterly these lesions (for the most part superficial and cicatricial) have been more properly appreciated and more frequently recognized The whole surface of the skin of a patient presenting such a lesion on the face should be systematically examined

The basal cancer has its origin in the basal cells of (*a*) the surface epithelium, (*b*) the hair follicle, (*c*) the sebaceous gland, (*d*) the sweat gland At the present time it is not always possible to state with certainty, by clinical inspection alone, the situation of the cell from which they arise, but in many cases we can, and with further research we may attain greater proficiency Many of the superficial tumours arising from the basal layer of the surface epithelium appear to have a perifollicular origin—that is, they appear to arise *from basal cells of the surface in the* neighbourhood of the hair follicle The deeper and more indurated growths arise from the basal cells of the hair follicle and the scirrhous type from the basal layer of the sebaceous glands I have, however, yet to meet with one which I could definitely state was of sweat gland origin, though such have been described

The basal-cell carcinoma is multiform, clinically we recognize the following types

1 Superficial cicatricial (Jacob's ulcer)
2 Hypertrophic
3 Cystic
4 Nodular and indurated
5 Morphoeiform
6 Pedunculated
7 Scirrhous

A very brief description of these varieties must suffice

1 *Superficial Cicatricial*—This arises as a small, translucent fairly firm nodule with usually a depressed centre, simulating *molluscum contagiosum*, it spreads eccentrically, cicatrizing in parts and leaving scattered nodules within an area (the surface of which often presents a rosaceous tint due to dilated vessels) bounded by a well marked raised gelatinous ridge It is usually very slow growing but may occasionally take on rapid growth, destroying all the soft tissues and invading bone (rodens Thibrans), or it may without extending laterally, produce deep cavitation with little external evidence This variety constitutes the vast majority of basal cancers, and is usually described as a "rodent ulcer" Only to such a basal cancer presenting the clinical picture of a rodent ulcer should this name be applied Many of the following varieties never ulcerate and never present a rodent tendency

2 *Hypertrophic*—The tumour presents a fairly firm mass raised well above the skin's surface with little tendency to infiltrate the true skin or to atrophy Ulceration may not supervene for many years

3 *Cystic*—Cystic formation may take place *de novo*, on the other hand, the cystic masses, with their gelatinous contents, may be the result of degeneration in the cell masses

4 *Nodular and Indurated*—Sometimes the basal cancer (especially when arising from a hair follicle) appears as an indurated mass with much tumour formation, and little ulceration, deeply invading the true skin This variety is often mistaken for a squamous cancer

5 *Morphoeiform*—Simulates a patch of localized scleroderma It has a waxy, ivory like appearance, with dilated capillaries ramifying over its surface It may escape ulceration for many years It is in my experience quite rare, and the majority of the cases I have seen have been on the forehead, though it may appear anywhere

6 *Pedunculated*—This is a still rarer variety In a recent case which presented other varieties of basal cancers elsewhere the patient had what appeared to be a pedunculated fibroma just below the left gluteal fold On examination we found it was a basal cancer

7 *Scirrhous*—The basal cancer of sebaceous gland origin presents a deep hard mass in the skin simulating secondary invasion of squamous carcinoma There is little tendency to ulceration

Much has been written as to the sex incidence in cases of basal cancer My experience is that the sexes are equally prone, whether the growth is solitary or *multiple* For the purpose of this paper I carefully went through my last 300 consecutive cases and found there were 149 women and 151 men There were 18 cases of multiple growths—9 in women and 9 in men Of these 18, 6 had twelve or more tumours, the remainder had only two to six

Metastases—Dr MacCormac has referred to three instances of metastatic growths in basal cancer To these I would add three more (1) one reported recently by Pinnerud of Chicago, (2) a case of my own in which, though the rodent ulcer at the side of a man's nose yielded to treatment and remained soundly healed, there appeared six months later a large indurated mass adherent to the lower jaw which was undoubtedly secondary to the rodent ulcer, and (3) a case recorded by Powell White in a recent demonstration on cancer research in which a metastatic growth was discovered *post mortem* in the liver of a man who had suffered for many years from a large rodent ulcer in the left suborbital region Though typical basal cells formed the mass of the new growths, parts of the sections showed some squamous cells so that, strictly speaking, the growth was of the "mixed" variety It is possible that the basal cancers in which metastases occurred were not pure but mixed growths

3 *Mixed Cancers*

Mixed cancers presenting on histological examination basal and squamous cells in varying proportions are not so rare as was formerly believed Dr MacCormac called attention to them some twelve years ago, and Darier has latterly emphasized this fact I have divided them into three types

(*a*) *MacCormac-Darier Type*—A tumour beneath the left lower lid was of nine months' duration, it was rather too large for a pure basal and not large enough for a pure squamous growth I therefore excised it, and found on examination an excellent example of a mixed cancer

(*b*) The second type I have called *squamo-basal*, and I can best describe what I mean by the following case A middle-aged man presented on the right side of his forehead a fairly large raised tumour, brownish in colour and firm to the touch He stated that he had had a "mole" there for fifteen years, but that within the last few months it had extended considerably I excised it, and found that rather more than half the tumour was composed of basal cells and that the basal growth had been invaded by a secondary squamous growth, from the overlying epidermis, presenting numerous cell nests—hence the cause of the recent extension There were no metastases

(*c*) The third type I have named transitional, it is *represented by old chronic basal cancers* which take on a more malignant rate of growth, and which on examination are found to have acquired a more squamous type of *cell An example of this kind I have already mentioned* in Powell White's case

There is still another variety of mixed tumour it is usually met with on the scalp, and is known as a *cylindroma* In some the basal cells predominate, and in others the squamous element is more manifest, but in all of them the stroma forms curious transparent cylindrical and oval masses of mucous degeneration which are found between the epithelial cells proper

4 *Naevo-cancers*

As the opener has ruled these growths as being beyond the scope of our discussion, I shall content myself with observing that they may arise on apparently normal skin, that they are not necessarily pigmented, and that the tendency of moles to become malignant has been greatly exaggerated

Precancerous Conditions of the Skin

A precancerous condition is one that will inevitably *become cancerous Is there such a condition?* Is one justified in stating that any or the most likely condition will necessarily acquire malignancy? I think not On the other hand, do not cancers apparently arise on practically all conditions of the skin? I have accordingly divided these so-called precancerous conditions into two groups

1. *Dermatoses on which cancers* do rarely arise but which in themselves cannot be considered as conducive to malignancy Under this heading I would include active lesions

of lupus vulgaris, lupus erythematosus, secondary syphilis, and psoriasis I have seen the squamous variety only in cases of lupus vulgaris and lupus erythematosus, but in syphilitic and psoriatic patients I have had both squamous and basal cancers In chronic psoriasis when arsenic has been administered over a prolonged period, it may have been the drug and not the psoriasis lesion which was responsible for the development In one case of psoriasis under my colleague Dr G H Lancashire, there was a carcinoma on an old lesion, but Dr Jenkins, our histologist, reported that the tumour did not appear to be primary in the skin but a secondary growth The patient was not seen again Only last week I saw an old case of psoriasis in which many of the lesions had persisted for years, and some of the so-called psoriasis lesions appeared to be superficial basal cancers I have not yet, however, had the opportunity of making a histological examination Whitfield, many years ago, described the supervention of a rodent ulcer on a psoriasis lesion, and Gray has shown a similar case I have not seen one so arise, but I have seen a few in conjunction with psoriasis I have, however, had one case of a squamous cancer arising on a patch of psoriasis when arsenic had not been administered

2 Dermatoses which not infrequently become cancerous These may be classified into (A) congenital, and (B) acquired

(A) *Congenital*
- (1) Malformations—Naevi
- (2) Dystrophies—Xeroderma pigmentosum

(B) *Acquired*
- I Inflammations
  - (1) Hyperkeratoses (*a*) Seborrhoeic keratosis (*b*) Horns (*c*) Warts
  - (2) Chronic ulcers
- II Physical agents
  - (1) Exposure Sailor's skin (Unna)
  - (2) Actinic rays X rays and sunlight
- III Chemical agents (*occupational*) Tar, arsenic, paraffin, soot, etc
- IV Atrophic lesions Biotripsis (Lenthal Cheatle), senile keratosis
- V Scars of lupus vulgaris, burns, syphilis, and lupus erythematosus
- VI Trauma
- VII Paget's disease (mammary and extramammary)

Time will only allow a very brief reference to the above conditions

Naevi—These growths are so universal and the incidence of squamous or basal cancers so extremely rare as hardly to justify their inclusion in this group I have seen, however, a case of a pedunculated basal cancer arising on a linear naevus (acanthotic naevus)

Xeroderma Pigmentosum—This condition, which is usually congenital though sometimes acquired, is, on the other hand, very prone to malignancy (especially of the squamous variety) I know, however, a case of many years' duration on which no suggestion of a cancer has yet appeared, and other similar cases have come under my observation

Seborrhoeic keratosis is the fruitful source of multiple squamous cancers of the face

Horns frequently show evidence of squamous invasion at their base, but whether the horn is secondary to the cancer or the cancer secondary to the horn I cannot say

Warts—Senile warts on the back of the hands (apart from senile keratosis) should be excised—many apparently benign are the precursors of squamous cancer

Chronic Ulcers—If care is not taken in cutting sections of the edge of a chronic ulcer one may get a picture very suggestive of carcinoma In my experience the incidence of malignancy in simple chronic ulcers is extremely rare

Sailor's Skin—When a man's occupation has necessitated his being exposed over prolonged periods, whether on sea or land, to all sorts of weather, we not infrequently find the supervention of squamous or basal growths on keratosic foci, especially on the face and backs of the hands

X Rays—Unfortunately there is no need for me to emphasize the incidence of squamous cancer in x-ray dermatitis Its frequency in recent years is well known to us all

Sun's Rays—Paul of Sydney states that the majority of rodent ulcers in Australia arise on keratosic lesions produced by the actinic rays of the sun Though one sees such cases occasionally they are not so frequent here Squamous cancers, too, may so arise In a case which I have had under observation for many years the keratosic lesions occurred after the appearance of a basal cancer on the left cheek Basal and squamous cancers developed later on these keratosic foci

Chemical Agents—There is little need for me to allude at length to what might be termed "trade cancers" It is so well recognized that workers with tar, arsenic, and paraffin are subject to "cancerous ulceration" Chimney sweeps' epithelioma of the scrotum is now comparatively rare, but mule-spinners' cancer seems to have taken its place

Atrophic lesions are usually seen in elderly people, and are attributed to senility of the skin—due to natural wear and tear of life Cheatle has well described this condition under the title of "biotripsis" It is a condition which a busy dermatologist must frequently see "Senility" of the skin is not confined to the aged, and many old people have not senile skins On this atrophic skin flat papular lesions may appear, which may be smooth or may be covered with horny scales, and may later assume more marked keratosis, on which squamous or basal cancers not infrequently develop The sites of election are on the temples and backs of the hands

Scars—On the scar tissue of lupus vulgaris squamous cancers are very prevalent, whether the lupus has been treated by x rays or not Some twelve years ago I found that of fifty such cases 50 per cent alone had had radio therapy Now, however, the proportion is much greater I have never seen a basal cancer on scar tissue, though one simulated a rodent ulcer I have referred above to the age incidence of these scar cancers, but before dismissing this sequela I would like to stress the importance of keeping all lupus cases under observation for years after apparent cure, and the necessity for removing any early keratosic papule which might appear on the resulting scar, as it will invariably be found to show malignant change

Squamous cancers on the scars of [illegible] do occasionally occur Rarely one sees [illegible]ing on the scar of a primary syphilitic sore, and not infrequently on secondary syphilitic scars The scars of burns often present, many years later, malignant tumours, and here, as in other scar cancers, the malignancy is not very rapid In a recent case of my colleague's (Dr Gibson) the new growth arose on the scar of a burn on the right elbow The accident happened forty years ago The epithelioma is of seven months' duration and is fairly extensive, but no enlarged axillary glands are palpable

Trauma—A few cases of epithelioma resulting from a single blow have been recorded by competent observers, but such require very thorough investigation One frequently gets the history of injury, but on careful cross-examination it is found that the trauma was subsequent to a pre-existing pimple or that the blow was on the other side of the face

Paget's Disease of the Nipple

Much discussion has taken place with regard to this somewhat rare condition in relation to mammary carcinoma No one would deny the frequency of the association of the two conditions, but to assert that malignant disease of the breast invariably supervenes on Paget's disease is incorrect I have had three cases of long standing which were unassociated with malignancy Powell White, too, in his recent demonstration, recorded a case in which a thorough *post-mortem* examination revealed no evidence of malignant disease

Some cases of duct cancer which have ulcerated through the skin have been mistaken for Paget's disease Many authorities consider this condition to be malignant *ab initio*, but to me its histology does not warrant such a conclusion "Dyskeratosis" acanthosis, and cellular infiltration of the corium are present in many benign lesions, and do not necessarily signify a precancerous or cancerous condition Some contend that the skin lesion is secondary to

cancer of the gland, but recently Lenthal Cheatle has very ably contested this view, and shows on histological findings that there is no such connexion Cheatle however, is of the opinion that Paget's disease and mammary carcinoma are the effects of the same cause If we accept this view then we may look upon Paget's disease as a paracancerous condition

Paget's disease of extramammary location is, I believe, of more frequent occurrence than the literature would lead us to suppose Bowen's precancerous dermatosis is identical with this condition but both require careful differentiation from the superficial basal cancers of the trunk I have dealt with these elsewhere and will not now discuss the matter further

Etiology

I think we are all agreed that the outstanding etiological factor in the production of cancer is *chronic irritation*, whether the irritant be mechanical, chemical or physical Two areas of the face most liable to irritation, the inner canthus and the ala nasi, are the most frequent sites of origin of basal cancers, and the frequent sites of their incidence on the trunk are on areas irritated by seborrhœa or sweat

On histological examination of cancers we are apt to confine our observations to the state and character of the *proliferating epithelium* but the condition of the corium, especially in growths *supervening on previous dermatoses*, show marked degenerative changes It is possible, too, that though the true skin in the cases in which the cancer develops on apparently normal skin may show no such lesions yet the derma may have undergone some change prior to the invasion of the epidermal cells

Manchester is the centre of a vast industrial population Its atmosphere like that of the neighbouring towns, is not free from chemical irritants It is not therefore surprising that we should see a relatively large number of these cases of cancerous and precancerous conditions of the skin

In conclusion I should like to express my thanks for much valuable assistance to Dr Powell White, to Professor Shaw Dunn, and to his laboratory steward Mr Southall (who has cut many of my sections and prepared the microphotographs) and also to my colleague Dr G H Lancashire for allowing me to investigate many of his interesting cases

[Dr Savatard showed a number of microphotographs in the course of his paper]

GENERAL DISCUSSION

The President, Dr J M H MacLeod (*London*) in opening the discussion, said that while he agreed with Dr MacCormac that all stages of transition might be encountered between typical basal celled carcinoma and squamous-celled epithelioma, the extreme ends of the group, it seemed to him to be inadvisable to neglect these distinctions, as they were of the greatest value in indicating the proper line of treatment The basal-celled type was amenable to curetting followed by radium or *x* rays, while the squamous type should be excised He also desired to draw attention to another useful histological indication of the degree of malignancy—namely, the type of cellular infiltration in the *corium* He had found that where the infiltration was of the plasma cell type the malignancy was less than where it was of a more simple inflammatory type The frequency of lupus carcinoma had increased considerably at Charing Cross Hospital since the employment of *x* rays in the treatment of lupus, and lupus epithelioma was really an epithelioma developing on an *x*-ray scar

Sir Norman Walker (Edinburgh) admitted that the name rodent ulcer was not a good one, in the early stages the condition was neither rodent nor an ulcer He held that rodent ulcer began at an earlier age than was stated by some authorities As to the origin of skin cancers, he believed that these carcinomata might arise from any of the epidermic cells He had recently examined the statistics of his department for the last eighteen years and was rather surprised to find that rodent ulcer was almost equally common in the two sexes He had previously supposed that it was commoner in males than in females He had had a deplorable record of carcinoma following lupus in cases treated over twenty years ago by *x* rays, and questioned whether the use of that remedy was justifiable in that disease

Dr S E Dore (London) said that in his opinion a definite distinction should be drawn between what was universally known as rodent ulcer and squamous-celled carcinoma on account of the different clinical courses of the two conditions It was not, however, always possible to distinguish between them without microscopical examination He recalled four cases under his care which were clinically indistinguishable from rodent ulcer in which their failure to respond to radium treatment had necessitated excision of the growths, and these all proved to be prickle celled carcinomata Another case, diagnosed at first a rodent ulcer, perforated the malar bone and was rapidly fatal from extension of the growth He thought that, failing a preliminary microscopical examination, response to radium treatment was an important distinguishing feature

Dr Goodwin Tomkinson (Glasgow) said that some years ago a patient who had suffered from psoriasis came under his care at the Western Infirmary presenting a large psoriasiform lesion on the back A portion of this lesion suggested rodent ulcer, and although no histological examination was made he treated it, in accordance with his usual custom, with radium emanation Presumably the diagnosis was correct, for the condition cleared up It then appeared that some years previously a left mastoidectomy had been performed on this patient for what he said was "cancer" Moreover after a considerable interval since the cure of the dorsal lesion, a typical early rodent ulcer had appeared on the right lower eyelid, which was excised Dr Goodwin Tomkinson considered this to be a particularly interesting case of multiple malignancy He did not think that the initial lesion on the back was necessarily a precancerous condition He pointed out that, happily, although all human beings possessed sweat and sebaceous glands, by no means all developed malignant growths of the skin What therefore, was the cause of the malignant tendency which appeared to exist in some skins? All dermatologists would agree that this malignant tendency was not the monopoly of those in middle and old age Was the cause a congenital one?

Dr Rupert Hallam (Sheffield) said that it was interesting to hear both speakers lay stress on the rare occurrence of *metastases from squamous-celled carcinoma* of the skin This raised an important question—namely, whether these cases should be handed over to the surgeon for excision of the growth and also of the neighbouring glands The speaker had sometimes found it difficult to persuade his surgical colleagues that small growths of merely a few weeks' duration were really epitheliomata and urgently *required excision*

Dr MacCormac, in his reply, said that his intention had been not to overload the terminology, but rather to simplify it The age of onset in the series quoted was taken from the period of the earliest noted lesion, not from the time when the patient came under observation There was admittedly a distinction between the so-called "basal" and "prickle" types, but from what Dr Dore had said it was clear that it was at times impossible to distinguish them by their objective characters It would therefore seem advisable to perform a biopsy before deciding upon the type of treatment Although metastases were relatively uncommon in carcinoma of the skin, never-theless it was proper to deal with the "prickle-cell" type by surgical measures, including the removal of any enlarged glands, reserving radium or *x* rays for the radio-sensitive "basal-cell" type Dr MacCormac added that he did not wish to drop the term "rodent ulcer," but that he was trying to prove that so-called rodent ulcer or basal-celled carcinoma of the skin was more closely allied and had more in common with epithelioma or prickle cell cancer of the skin than was generally supposed.

BAKERS' DERMATITIS

BY

ALLAN C PARSONS, M R C S, L R C P, D P H,

Ministry of Health

UNTIL quite recently little had been heard of bakers' dermatitis in this country, and the textbooks of such authorities as Sequeira, Stelwagon, and Prosser White contained but brief references to this particular trade dermatosis Towards the end of 1921, however, the Amalgamated Union of Operative Bakers became perturbed by the increasing number of their members who were receiving sick benefit on account of "bakers' itch," and asked the Ministry of Health if this disease could be officially investigated Such an investigation was started early in 1922 under the joint auspices of the Ministry of Health and the Home Office Information was sought from two main sources (*a*) from bakers, millers, and caterers, and (*b*) from the dermatological clinics throughout the country Personal investigations were also made in Liverpool, Manchester, South Wales, and other places where the cases were chiefly reported

The contention of the Bakers' Union that bakers' dermatitis became unusually prevalent during the war and after is not supported by the medical evidence, which was not confined to dermatologists attached to hospitals, but was received also from certifying factory surgeons and general practitioners The evidence from the Master Bakers' Association, from high-class catering establishments in London, and from the leading millers throughout the country was also negative Field investigations showed, as several dermatologists had suspected, that the terms "bakers' itch" and "bakers' dermatitis" were loosely used, and probably not more than half the cases of dermatitis reported among bakers were cases of bakers' dermatitis It is interesting to note that the alleged increase in this condition took place during the war, when skin affections generally, and particularly scabies, were unusually prevalent

As regards distribution, most of the cases were reported from Liverpool, South Wales, and Newcastle, the remainder were distributed in Manchester, the West Riding of Yorkshire, Bristol, and Nottingham Very few cases were heard of in London, and it was significant that in this city trade unionism is not nearly so highly developed among bakers as it is in Liverpool and South Wales The majority of patients who were visited lived and worked in the humbler streets of Liverpool, Cardiff, and Newport A more important fact is that in over 60 per cent of the reported cases from all districts the patients at the time of their illness were working in bakeries where the dough was made entirely by hand, while in the great majority of the remaining cases the affected bakers were employed at the dough-mixer With one or two exceptions the cases were confined to males, and most of the patients, when attacked, were approaching middle age

By the union officials and by the affected bakers themselves many hypotheses concerning the exciting causes of bakers' itch have been put forward In Liverpool the indifferent brands of flour used during the war were suspected, in Wales the refining processes used by millers were thought to be responsible, some blamed the yeast and others the powders used in the making of cakes The fact that no cases of dermatitis were reported among millers helps to dispose of the suggestion that either the flour itself or some process used in its refinement was responsible, moreover, cases of bakers' dermatitis continued to be reported by the Bakers' Union after the flour had again become normal in quality

Sugar was certainly a possible contributory cause in a high proportion of cases, and in a few single instances "cream powder" and salt were directly responsible The evidence goes to show, however, that in most bona-fide cases of bakers' itch the eruption is usually caused by the mechanical irritation of the dough Rarely it was found that certain elderly bakers, after a long period of immunity, developed a sensitization to flour protein The eruption is usually seen on both upper limbs, and is limited to those parts which come in contact with the dough—namely, the hands, wrists, forearms, and the elbow regions as far up as the line of rolled shirt-sleeve There may be patches behind the ears, while in severe cases of sensitization the whole body may become involved A preliminary sensation of itching is followed by a vesicular erythema, and in untreated cases a general folliculitis supervenes sooner or later Secondary infection may occur with the formation of suppurative dermatitis In cases of some duration there develop patches of inflamed and furfuraceous skin, resembling certain forms of lichen or even psoriasis The diagnosis, however, should rest chiefly on the history, the localization of the eruption, and the characteristic fact that when the patient gives up his occupation the dermatitis will, in most cases, disappear without further treatment On the assumption that manual contact with dough is the usual cause of bakers' dermatitis, it may be assumed that with the substitution of machinery in bakeries the risks of bakers' dermatitis will correspondingly diminish In the meantime there is a need for far better toilet facilities in those baking establishments from which cases of bakers' dermatitis are most commonly reported

DISCUSSION

DR MACCORMAC only rarely met with examples of bakers' dermatitis In one case where the eruption seemed to be due to the salt used in baking he had advised the patient to wash and then apply olive oil As a result there was marked improvement, although the individual had remained at work

DR DORR had been struck by the relative infrequency of bakers' dermatitis in his department One patient under his observation who was a baker in an infirmary attributed his dermatitis to yeast, but sensitization tests were made and he gave no response He recovered as soon as he was removed from his work, and the condition had not relapsed It was thought that salt might have been the cause in this and other cases

DR H C SEMON referred to a recent case in which legal proceedings were being taken by the plaintiff's union against his employers The patient was a journeyman baker, 29 years of age, and had been baking in other establishments without having any skin trouble to complain of In January, 1921, an irritable dermatitis developed on the hands and forearms His panel doctor attributed it to his work, which he gave up for a week or two, with the result that the lesions cleared up On his return to kneading dough the dermatitis returned, but cleared up again when work was once more abandoned This sequence of events had been repeated on three or four occasions during the last two years Before his last attack his occupation had been changed, for he had been entrusted with the care of an incinerator for the destruction of debris, which was delivered to him in old flour sacks Whether flour was the direct cause in this case or not was open to discussion, but it would appear that the appearance of the dermatitis after his change of occupation was an argument that it was The case resembled that reported by Dr H W Barber, in which the cutaneous sensitization test to wheat protein was positive The speaker thought the investigation of cases from this point of view by dermatologists would certainly be of value in the elucidation of the etiology and prophylaxis of preventable trade dermatoses

DR R A VEALE was impressed by the increase in the number of cases of bakers' itch that had occurred in his hospital clinic during the last two or three years He wondered whether any adulteration of the flour might be a possible cause Common salt was often blamed Treatment was often difficult and prolonged because the skin seemed to be sensitized so as to respond to other forms of irritant besides the original

Memoranda:
MEDICAL, SURGICAL, OBSTETRICAL

SPONTANEOUS RUPTURE OF THE HEART

DR I R GILMORE'S case (August 30th, 1924, p 373) is in several respects similar to three I have seen within the past two years All died suddenly and unexpectedly, in one case only was there even a suspicion of previous disease of the heart

Case I

A retired merchant aged 71 in the effort to get out of bed one morning complained of pain in the head and dizziness His wife then noticed his pallor but before she could get to his bedside he had fallen on to the floor cutting his right forehead, the wound bleeding only slightly I saw him within a few minutes he was dead His wife stated that he had made no previous complaint of illness or pain

Post mortem Examination—A stout big pale-skinned man with pasty appearance of face The pericardium was full of blood this was carefully swabbed out and the heart found to be enlarged and fatty A rough tear in the left ventricle extended downwards for about 1½ inches (about half an inch in the aortic cavity) and at its middle penetrated through into the ventricle There was atheroma of the aorta with roughness of its internal surface there was some thickening of the mitral and aortic cusps near their mural attachments

Case II

A woman aged 63 became sick and fainted while finishing breakfast and quickly collapsed When seen almost immediately she was propped up was practically pulseless with sighing breathing and dilated pupils she died within a few minutes

Post mortem Examination—A spare woman who appeared older than her years The pericardial sac was full of blood and was carefully swabbed out The heart was somewhat enlarged and exceedingly fatty There was a tear in the left ventricle which extended from the wall of the aorta downwards for about 1½ inches and in its lower half penetrated into the ventricle The upper half of the wound was only partially through the wall of the aorta and in it were older clots and some attempt at organization the appearance being suggestive of a wound which had been gaping and at the same time attempting to heal for some days The aortic wall was thickened but there was no palpable sign of disease in the valves

Case III

D C a stout plethoric woman aged 70 fell forwards at the tea table and rolled on to the floor she was found to be dead About half an hour before she had hurried back from a walk on account of sudden abdominal pain and diarrhœa She had complained occasionally of breathlessness on exertion for some months previously but not of pain

Post mortem Examination—The pericardial sac was full of blood This was swabbed out and the heart was found to be enlarged and extremely fatty There was a rough irregular tear in the wall of the left ventricle measuring about 1½ inch and it extended from close to the aorta downwards and penetrated the cavity of the ventricle about the middle of the tear This tear involved on its inner aspect aorta and ventricle The aortic and mitral cusps were thickened and the inner wall of the aorta was thickened and rough—evidently in a condition of fairly advanced atheroma

All three cases showed advanced fatty disease of the heart with sclerotic changes in the aorta, more or less, and had died from the same cause In each the wound was in the same area and ran roughly parallel with the interventricular septum, at an area where the wall was weakest or where it was subject to greatest strain

To my mind the questions which present themselves in considering the above cases are these

1 In rupture of the left ventricle does the tear usually occur from above downwards? In my second case it certainly did

2 Was the exciting cause of the rupture purely mechanical and caused by a sudden temporary rise in blood pressure acting on a diseased ventricle wall?

3 Occurring near the left septal division of the auriculo-ventricular bundle, was it possible that a sudden abrupt commencing of ventricular fibrillation caused a wave sufficiently violent to start a tear?

I feel that the record of these three cases is incomplete each examination was made in the hurry of things and further detail could not easily be got

Rupture of the heart appears to be a commoner mode of death in fatty disease than is generally believed

ECHINOCOCCUS OF THE HEART

I was interested to read the memorandum (August 16th, p 277) on a case of echinococcus of the heart Some years ago in India a gunner, who had recently come up to the hills for short leave, feeling slightly out of sorts after dinner, went for a pony ride to shake it off He was found about an hour later leading the pony and feeling very queer, ten minutes later he was dead

At the *post-mortem* examination the heart felt very tense and on opening the left ventricle its cavity was found to be occupied by a cyst the size of a golf ball, there appeared to be no room for any blood

A microscopical examination could not be made, but the macroscopic appearance of the cyst resembled echinococcus There were smaller cysts in the brain and kidneys, but none in the liver

The most remarkable feature of the case was the fact that the soldier had been playing football a few weeks earlier without distress Probably the extra strain demanded by taking exercise in the hill station, situated at 7,000 ft above sea level caused failure in the heart which had functioned normally in the plains

NEUTRALIZATION OF INSULIN BEFORE INJECTION

INSULIN injected subcutaneously nearly always gives rise to more or less pain of a stinging or smarting character in addition to the slight pain necessarily caused by any subcutaneous injection of fluid In *some* patients the stinging pain is so great that they dread the daily repetition of it

As well as pain some patients have within a few minutes of the injection an erythema or patch with heat and tenderness spreading to two or three inches in diameter lasting for one two or three days and leaving an indurated nodule for quite a long time

Insulin as at present prepared is very unstable except in a distinctly acid solution Dr O'Brien and Dr Trevan of the Wellcome Physiological Research Laboratories suggested that this acidity might be the cause of the stinging pain and erythema Dr Trevan made a series of experiments with insulin the acidity of which had been neutralized at the time of injection by the addition of a sufficient amount of sodium bicarbonate and found that insulin with its acidity neutralized in this way gave identical physiological reactions as similar doses of unneutralized insulin, used at the same time and under the same conditions

He then very kindly supplied me with a 6 per cent solution of sodium bicarbonate with 3 per cent tricresol, sterilized by filtration through a Berkefeld filter, about 0 25 c.cm of which is more than sufficient to neutralize 1 c.cm of the preparation of insulin made by Burroughs Wellcome and Co I have used the preparation thus neutralized daily for three weeks, and find that the smarting and stinging previously complained of have quite ceased, and also that the local erythema is no longer produced in a patient who previously suffered very severely from it The *physiological effect on the cases so treated* has not been checked, but there is no reason to think that the potency of insulin used in this way is at all diminished

It is important not to let the alkaline solution get into the stock insulin bottle, if the contents of that become alkaline the insulin will disappear on standing The insulin should be drawn into the syringe first, then the alkaline solution with a bubble or air, the whole shaken until mixed, when the solution becomes slightly turbid, and the air expelled

Beckenham. GEORGE P STILWELL, M B Lond

TWO CASES OF MUSHROOM POISONING

On account of the rarity of literature on poisoning due to eating *Amanita phalloides* fungi, the two following cases, which came under my observation recently, may be of interest

Two officers ate what they considered to be mushrooms at 12 15 p m At 12 45 they began to feel ill at ease, they

complained of acute abdominal pain in the epigastric region, of pains in the bladder and penis, and a desire to micturate, they sweated profusely

At 1 15 they were seen by me, their symptoms, in addition to those mentioned, were vision extremely blurred, unable to distinguish any features of people around them, profuse cold clammy sweat, extremities quite cold, no pulse to be felt at the wrist, heart beats fast, weak, and very irregular, breathing fast and shallow Both patients had a severe rigor and profuse salivation The mentality remained clear

The treatment consisted of a copious mustard and water emetic In the vomit there were large quantities of the supposed mushrooms, which have since been identified as *Amanita phalloides* fungi Atropine sulphate 1/100 grain was given hypodermically, and this controlled the perspiration and salivation to a certain extent Digitalin 1/100 grain and strychnine sulphate 1/60 grain were then given hypodermically, followed by two ounces of brandy by the mouth

The patients were put to bed in blankets and packed round by hot-water bottles After an hour the vision became clear and the patients gradually improved till after five hours they had quite recovered For about two days they felt slight abdominal pains, but these gradually passed away The temperature remained subnormal throughout the attack

Reviews.

THE DIAGNOSIS OF NERVOUS DISORDERS

IN the endeavour to keep pace with the continuous advances in neurology, SIR JAMES PURVES-STEWART has made many changes in his well known book on the *Diagnosis of Nervous Diseases*, the sixth edition[1] of which has recently been published Every chapter has been revised, that on the psycho-neuroses has been completely rewritten, and a short chapter on delirium has been inserted Though the book deals comprehensively with its subject, it is not intended to be a textbook It is rather, as its author says, an appendix, approaching the subject from a clinical point of view, and intended to be used in conjunction with other standard works The book is written from an essentially practical standpoint, and by supplying details of the methods of clinical examination, together with indications of the significance to be attached to the various nervous symptoms, it is well suited to the needs, not only of the teacher and specialist, but also of the general practitioner, to whom it will be invaluable as a book of reference

The major portion of the new chapter on the psycho-neuroses is occupied with a clinical description of the protean manifestations of hysteria Though the author discusses the psycho-neuroses from a psychological standpoint, he defines a neurosis in neurological terms as "a molecular abnormality of the nervous system (whether cerebro-spinal or vegetative, or both together) characterized by abnormal reactions to ordinary stimuli" It is a difficult matter to formulate an entirely satisfactory definition of what we now include under the term "neurosis" The author's definition is based upon the view that the boundary between organic diseases and the so-called functional neuroses (a term here used as synonymous with the psycho-neuroses) is wholly imaginary, and that disordered function is impossible without some underlying physical basis Few neurologists would be disposed to deny the existence of some organic difference between the subject of a neurosis and a normal person, but the definition as a whole might be criticized on account of its essentially physiological colouring The neuroses are disorders of personality, and in practice the neurotic has to be approached, described, and treated, not as a nervous system reacting abnormally to simple stimuli, but as a person reacting abnormally to complex situations In a neurosis the functions of the organism are disordered at the highest, most recently evolved, and therefore most sensitive, levels of evolution, and, as Janet urged many years ago, this fundamental clinical fact should be made evident in a definition of the cases which we include under this category

The author gives a few useful diagnostic points of differentiation between the neuroses and psychoses There is still, however, much need for further investigation into this very difficult problem In the early stages of mental disorder it is often hard to distinguish a neurosis from a psychosis, and the whole question is complicated by the fact that an illness showing all the characteristic symptoms of (say) an obsessional neurosis, may change its character and develop pronounced and incurable delusions The fact that a new edition of this work had become necessary abundantly indicates that it meets the needs of the student of clinical neurology, and we have no doubt that the author's hope that the sixth edition may prove more useful than any of its predecessors will be fully realized

BISMUTH IN SYPHILIS

THE use of bismuth as an alternative treatment of syphilis has been carefully recorded from time to time, so that readers have been able to form their own opinion of its value As usually happens, its first advocates were probably rather too enthusiastic, and it is convenient to have a compact essay[2] by two French clinicians—BRIN and LEGRAIN—clearly setting out the present position, giving an account of the action of bismuth on syphilitic lesions, of incidents in the course of treatment, stating indications for its use, and describing the various preparations employed

Bismuth is usually given by intramuscular injection, but it can also be administered intravenously or subcutaneously. The metal can afterwards be found in the blood and cerebro-spinal fluid, and in almost all the organs and tissues of the body, it is believed, however, that the meninges are impermeable to it Elimination is effected by the kidneys and intestines, in the salivary and mammary glands, and in bile and sweat If the salt administered be insoluble, bismuth appears in the urine in eighteen hours, and may be recovered twenty to thirty days after a course of injections After the soluble salts elimination commences in two hours and reaches its maximum in twelve to fifteen hours A full account is given of the various preparations, and their content of bismuth is stated It would appear that the activity of a preparation depends not only on the amount of metal contained in it, but also on the chemical constitution, ease of disintegration, and facility of absorption The preparations used are arranged in three main groups insoluble preparations in an oily medium, including the tartro-bismuthates, oxides, and iodo-bismuthates, colloidal preparations (neotrepol spirillar, and bicoloid), and soluble preparations, such as luatol, tribisol, and gabismuth The insoluble preparations are the most generally useful, a "course" usually consists of fifteen to twenty injections, and an interval of not less than three weeks is allowed between courses, the dose of each preparation is stated and the method of administration clearly explained it should be followed in detail When toxic results ensue they may be local, "immediate general," or "late general" The last named are the most important, they include stomatitis (of varying severity) and renal complications

Therapeutic results are considered in relation to the various stages of the disease and the Wassermann reaction The indications for the administration of bismuth are classified as absolute and relative the former include cases resistant to arsenic and mercury, of arsenic intolerance, and of chronic visceral syphilis Contraindications are few They include cases where the mouth is in such a bad state that severe stomatitis would almost inevitably follow cachexia, and albuminuria not due to syphilis Bismuth may be associated with arsenic, mercury, and iodine, but preferably with the first named The authors summarize their conclusions as follows

1 Bismuth comes between arsenobenzol and mercury in activity
2 Its administration is simple and practicable
3 It is without danger, no death due to bismuth has been reported

[2] *Le Bismuth dans le traitement de la Syphilis* Par Louis Brin et Pierre Legrain Paris Octave Doin 1924 (Imp 16mo pp 96 fr 6)

4 The insoluble salts especially the oxides and iodobismuthates, have more effect on the Wassermann reaction than the soluble
5 Bismuth is specially useful in cases where arsenobenzol is contraindicated
6 The only serious contraindication is albuminuria
7 Bismuth should be used in association with arsenobenzol because the latter counteracts the effect of the former on the mouth and the two are the most powerful antisyphilitic remedies we have

The final general recommendation is that syphilis should be treated with arsenic and mercury followed by bismuth The book, though small, is a veritable mine of information, and contains most of what is known at the present time regarding the treatment of syphilis by bismuth The various questions that arise are dealt with in sequence and with sufficient fullness to enable anyone who has not previously given a bismuth injection to undertake to do so

PHYSIOLOGY AS THE BASIS OF CLINICAL MEDICINE

It was with considerable interest that we noted the appearance of *Human Physiology A Practical Course*,[3] by Drs C G Douglas and J G Priestley A perusal of its pages has not merely convinced us of the excellence of the material contained therein, but has stressed the importance of the part investigation on man is playing in the elucidation of physiological processes

The book is an account of the practical course in human physiology which has been developed for the Final Honours School of Physiology in Oxford The authors have been at considerable pains in describing in minute detail the methods of investigating the physiology of respiration the respiratory exchange the blood, the gases of the blood the circulation the kidneys and the alimentary canal All reference to the physiology of the central nervous system has been omitted and the authors' reason for so doing—namely, "that this branch of the subject must be dealt with by one who has made a special study of it"—may be taken as indication that the subjects included are treated in a succinct and stimulating manner

We believe the teaching of human physiology is to-day assuming a position of ever-increasing importance in our medical schools, and the reason for this is not far to seek The development of the unit systems in teaching hospitals has created a demand for methods of investigation applicable to man in the pathological state at the very time when such methods initiated and developed largely by the Haldane school of physiologists are bearing such a rich harvest of purely physiological data We are grateful, therefore, that these methods should have been collected into the compass of a single volume by two investigators who have themselves contributed so much to this branch of experimental work

We commend the book whole-heartedly to the teaching staffs of medical schools, and are convinced that those engaged in the medical units will also find much therein of great value and solid worth

A BIBLIOGRAPHY OF EUGENICS

Eugenics, to Mr Chesterton, means "the control of some men over the marriage and unmarriage of others, and probably means the control of the few over the marriage and unmarriage of the many" If it were really as simple as this it would be a cause for astonishment to receive a large volume of 514 pages, containing some 10,000 references, and entitled *A Bibliography of Eugenics*,[4] by S J Holmes If, on the other hand, we agree with its founder that "National eugenics is the study of agencies under social control that may improve or impair the racial qualities of future generations either physically or mentally" our horizon becomes so far-flung that we can be surprised at nothing Our American friends evidently take the broader view, as evidenced by this collection of literature

Mr Holmes rightly points out in an introductory note that, the science of eugenics being still in its childhood, many valuable facts are being daily recorded, the significance of which remains unappreciated until they are brought into proper relation with other facts, and that a great waste of effort is going on owing to a general lack or vagueness of outlook upon racial problems In attempting the gigantic and weary task of sorting the vast amount of rubbish which has been written in the last two decades on eugenics as it appears on the platforms or in the publications of cranks, whose aim is to push some pet scheme for the reform of society from the still more vast amount of useful material which has a direct or indirect bearing upon eugenics in its wider sense the author merits our sympathy The aim of the science in its present stage of development is to attempt to extract from the history of man's failures and successes what are the biological laws which control his development and from the information thus gained to try to predict what line of action are most calculated to favour his healthy physical and mental progress It follows that the researcher into eugenic problems draws his material more from written records than from laboratory experiment, and finds it necessary to ransack the literature dealing with such wide fields as the heredity of human traits and defects, the hereditary factor in crime, vice, and disease, the selective influences of birth and death rates urbanization and emigration, on populations, and the effects of parental age consanguinity race mixture, and environmental factors on the child A bibliography attempting to embrace and classify this mass of writings has therefore, a distinct value, and our only regret would be that the present volume gives no information as to the contents of the writings collected beyond what is contained in their titles Very many of these will be found to be of little value to the student or researcher when he comes to read them and a smaller selection of the best papers with a few lines indicating what is to be found in each would, we think, have been even more useful than the present volume

TANTALUS

Mr Haldane has become responsible for a small family of little books—his *Daedalus* produced *Icarus*, and the two have begotten *Tantalus*, by F C S Schiller, D Sc, a Fellow of Corpus Christi College, Oxford

In his preface Dr Schiller shows himself very anxious not to be taken for a pessimist He believes the human race is degenerating, the herd is rushing down a steep place, but thinks it may be headed off from the final precipice "Mankind can make a fool of itself, as it always could if it does, its blood will be on its own head, for it has knowledge enough to avoid the dangers that threaten it, if it will use its knowledge properly" He claims therefore to be an optimist

Let us see

He begins by giving up any claim for improvement of man's bodily capacity or intellectual capaciousness The Cro-Magnon people thirty thousand years ago or thereabouts had finer bodies and bigger brains This is an *opinion no disciple of Sir Arthur Keith can hastily reject* Early modern man had not acquired immunity to some pathogenic microbes recent man resists, but on the whole the latter's survival "is determined far more by his relations to the social group to which he belongs than by personal efficiency"

The first concession is made when Dr Schiller admits that by the development of speech and its record in writing man has transmitted to his own and succeeding generations knowledge by which he has been able to give permanence to social institutions, and to his conquests over nature, while retaining a degree of plasticity the ant has lost This concession to the idea of progress is immediately neutralized by a really savage attack on the modern professor We do not recognize the science professor of our acquaintance in the portrait drawn, but history warns us

[3] *Human Physiology A Practical Course* By C G Douglas C M G M C D M F R S and J G Priestley M C D M Oxford Clarendon Press 1924 (Demy 8vo pp ix + 252 70 figures 12s 6d net)
[4] *A Bibliography of Eugenics* By Samuel J Holmes Berkeley California University of California Press 1924 (Sup roy 8vo pp 514)

[5] *Tantalus or the Future of Man* By F C S Schiller M A D Sc Fellow and Tutor of Corpus Christi College Oxford London Kegan Paul Trench Trubner and Co Ltd 1924 (Fcap 8vo pp 72 2s 6d net)

that there is truth in the assertion that we cannot "count on our academic institutions to save us from stagnation and decay even in matters of knowledge", still we are inclined to think that Aristotle was right in believing that an inborn craving for knowledge is characteristic of man's nature However, Dr Schiller has no doubt that civilization tends to physical and intellectual degeneration, a tendency made more rapid in its effect by the postponement of marriage, the small families in the aristocratic, professional, and middle classes, and among most classes of skilled labour, and the unwisdom of our rulers in ordaining "that a knowledge of birth control shall be a (fatal) privilege reserved for the intelligent and well-to-do They [our rulers] instruct the police to prevent it from penetrating to the poor and stupid" Matters are made worse by the advance of medicine and hygiene, and even obstetrics is to be blamed for saving "the lives of thousands of women whose physique is such that in former times they would inevitably have died in childbirth"

We are now more than three-fourths of the way through the book and begin to look for the optimism promised in the preface This, after Christian ethics have been dismissed, we find in eugenics and a more business-like study of psychology Man can save himself in this way, but the author does not presume to predict that he will This is rather disappointing Perhaps the next volume of the series will be entitled "Sisyphus"

BIRD MIGRATION

MR TAIT'S *Birds of Portugal*[6] is the only book that has been written in English solely about the birds of that country This may appear at first strange, but is explained by his interesting preface The author states that besides himself there is only one other field naturalist in the whole of Portugal He sadly remembers two others, both doctors, but they died some years ago Mr Tait has hitherto been known to ornithologists for his list of the birds of Portugal, published in the *Ibis* in 1887, and his frequent reports of birds procured in Portugal with migration rings upon their legs

Portugal is, ornithologically, a very important country, from the fact that it is on the high road along which the birds of Western Europe migrate from their northern breeding haunts to their winter quarters in the south Mr Tait has been watching, collecting, and studying the birds of Portugal for many years, and it is indeed fortunate that this important strip of Europe has found such a careful and enthusiastic historian Through his efforts the Portuguese newspapers were induced to publish particulars of any birds that were shot and found to be wearing migration rings on their legs The complete list of such birds is here printed It is headed by the lesser black-backed gull, with 46 specimens, 26 of these had been born and marked in the Faroe Islands, off the coast of Northumberland The author has a good deal to say about bird migration, particularly about the movements of the vast flocks of turtle-doves that pass along the coast in the autumn He records the interesting fact that the Portuguese chiffchaff and the minute fire-crest both winter in Portugal

If Portugal suffers from a lack of bird-lovers or naturalists, it more than makes up for this shortage by a very plethora of sportsmen, or rather gunmen, for when migration is in full swing these slaughterers assemble in numbers all along the coast and blaze away at every bird which passes within shot The result is that many species once numerous are becoming scarce, while some, as the purple water-hen and the bittern, appear to be extinct Mr Tait's book contains a few photographs, we wish he had given more The Latin and the English and Portuguese names of each bird are given, and when a bird is known by a different name in different parts of the country each is mentioned, the chaffinch has as many as twelve different names in Portuguese The book will prove useful both to the field naturalist abroad and the "closet naturalist" at home

[6] *The Birds of Portugal* By William C Tait London H F and G Witherby 1924 (Demy 8vo, pp xii + 260 10 plates 18 net)

NOTES ON BOOKS

THE *System of Radiography, with an Atlas of the Normal*, by the late DR IRONSIDE BRUCE, first appeared in 1906, at a time when the principles of successful radiography had hardly been worked out A second edition[7] has now been edited by MR J MAGNUS REDDING, the senior surgical radiologist to Guy's Hospital The general arrangement is as before, but the illustrations have been entirely renewed and certain modifications due to the advance of *x* ray technique have been made A short description of the methods, by which radiographs of the different parts are obtained in standard positions with the tube correctly centred, is followed by the atlas which constitutes the main portion of the book A photograph of the subject and the tube in position precedes the radiographic results In most instances radiographs of the part at 5 years, 10 years, and 25 years are reproduced side by side Beneath each radiograph is a short statement as to the abnormalities that should be looked for This is a very commendable scheme, and the radiographic illustrations are, on the whole, good Some, however, do not come up to the standard of excellence which modern apparatus has made possible This is the case in many of the reproductions of the spine and the pelvic region, in the majority of which fine bone detail is not shown The short reference to renal work, and the one radiograph reproduced would have better been omitted, as the technique suggested is out of date There is only one radiograph of the thorax, and radiography of the gastro-intestinal tract is apparently considered to be outside the scope of the volume As an introduction to the subject of the radiological appearance of normal bones taken at three ages of life, under standard conditions, however, the book should be of use to the junior student of radiology.

In *Blood Pressure Cause, Effect, and Remedy*,[8] Professor LEWELLYS F BARKER and Dr NORMAN B COLE of the Johns Hopkins University describe in language to be understood of the layman "the information he would like to have," and which may be for his good, inasmuch as a sane presentation of the subject may allay unnecessary panic Hence a book of this kind with its catholic appeal may, as the authors suggest, be in line with the whole trend of preventive medicine It is suggested that if the term "average blood pressure" is employed instead of "normal blood pressure," not only will it be more accurate, but less likely to worry those anxious about their condition Conquering any disinclination to read a book designed for a lay as well as a professional audience, the medical reader will find a sensible and well written presentation of the subject on these lines There is also a short chapter on low blood pressure and a glossary. The rather striking and gaudy paper cover informing the public that "This is an Appleton book" may detract from its popularity.

The work on duodenal intubation,[9] by MM M CHIRAY and J LEBON, which forms the latest contribution to the series of volumes on practical medicine and surgery issued by Masson of Paris, is an excellent introduction to the study of the subject After a short historical survey, in which the credit for the first successful duodenal intubation is rightly attributed to Einhorn of New York, an account is given of the various tubes employed, such as those of Einhorn, Gross, Rehfuss and Palefski, Pisani, and Carnot The application of the method is then described, including the preparation of the patient, the introduction of the tube and the recognition of its entry into the stomach and duodenum, the difficulties and facilities encountered, and the various modes of removal of the duodenal fluid The next four chapters are devoted to a consideration of the physical, chemical, microscopical, and biological characters respectively of the duodenal fluid In the following chapter, which deals with the diagnostic importance of duodenal intubation, the writers discuss its employment in cholecystitis, biliary obstruction, cancer of the bile ducts, diseases of the hepatic parenchyma, pancreas, and duodenum, and acute infections, especially enteric fever The last chapter, which is concerned with the therapeutical uses of duodenal intubation, contains a description of duodenal feeding, duodenal lavage, and the *Meltzer Lyon* method drainage of the bile ducts Bibliographies of French, British and American and German literature are appended

PREPARATIONS AND APPLIANCES

Tetraform.

CARBON TETRACHLORIDE has become recognized as a useful drug in the treatment of hookworm and other diseases caused by intestinal parasites. It is well known that commercial processes of manufacture lead to the occurrence of impurities. The dose given is relatively a large one, amounting in full to 60 minims. Some of the impurities which may be present as a result of the process of manufacture are toxic, notably carbon disulphide. It is accordingly important that carbon tetrachloride for medicinal use should have a high degree of purity. We have had submitted to our notice a sample of medicinal carbon tetrachloride manufactured by the British Drug Houses, Ltd., which they supply under the proprietary name of Tetraform. It has been examined by our analyst. He reports that it is a highly refined article. He was unable to detect any of the impurities which are most usually found in commercial samples of carbon tetrachloride. He notes particularly the absence of aldehydes and states with regard to carbon disulphide that a test capable of revealing its presence in a proportion no greater than 5 parts per million gave a negative result.

Dial, Didial, and Dialacetin

We have before us three hypnotics prepared by the Clayton Aniline Company, Ltd., according to the formula of the Society of Chemical Industry in Basle.

Dial or diallylbarbituric acid, is a powerful hypnotic of the veronal group. It has been on the market for some years. Pharmacological experiments have shown that it is about five times as strong as veronal, but the makers claim that it is much more rapidly oxidized in the body and therefore is less liable to produce a cumulative effect. Reports by the makers suggest *that the therapeutic dose has a remarkably wide margin of safety, for the ordinary dose is about 3 grains, and records are given of persons recovering after taking between 20 and 30 grains.*

Didial consists of a mixture of dial with ethylmorphine. This combination is recommended particularly for initiating anaesthesia and inducing twilight sleep.

Dialacetin consists of a mixture of dial and allylparacetamino phenol being a coal tar antipyretic allied to phenacetin. The mixture possesses hypnotic analgesic and antipyretic actions and is said to be indicated as a sedative in febrile conditions associated with headache etc. It is interesting to note that this last mixture has been tried in France as an alternative to bromides in epilepsy.

The makers state that all three drugs are included in the Part I schedule of poisons, but that they do not come under the regulations of the *Dangerous Drugs Acts*.

Parathyroid Gland

Messrs. Burroughs Wellcome and Co. are supplying tabloids of parathyroid gland each representing 2/5 grain of fresh gland equivalent to 1/10 grain of the desiccated gland substance. The firm informs us that the glands are dissected out by trained workers and that a careful inspection checked by microscopic sections is made to ensure the genuineness of the product.

Prunol

Prunol is a laxative jelly made by Prunol Ltd. (4 Pickering Place, St. James's Street, S.W.1). It is stated to be compounded of prunes, Demerara sugar, senna and ginger. This combination has, of course, been well known to the medical profession for the last fifty years. It is said to have been originally introduced by Sir James Paget and has proved itself of great value in cases of chronic constipation *particularly in children*. Prunol is supplied in stoppered jars, price 1s. 10d.

Suprapubic Drainage

Mr. JAMES MACMUNN (London) writes: In my experience all pumps and siphons or allowing the urine to soak into dressings are less satisfactory than the plans here illustrated.

Fig. 1 allows the urine to be absorbed and discharged as fast as it is secreted by means of the large volume of absorbent gauze, beginning at C and ending at C, A is a metal tube over which B a rubber tube is slipped. Over B a rubber ring (D) is placed—a large umbrella ring will do—which introduced into the bladder wound pulls the latter into close contact with the parietes, falling away of the bladder from these is of course one of the causes of leakage. The bladder wound is sutured round the tube. E are two stout strings brought out either through or out side the tube to be tied round A so as to keep D in position; their untying allows the tube to be with drawn, D being left in the bladder and then withdrawn edgeways by one of the strings. F is a rubber tube, preferably an inner cycle tube for lightness, to hut in the gauze. The apparatus can be used as a siphon as well as a drain, or as a siphon alone. The gauze is introduced by a long wire and wetted. Irrigation may be used through A.

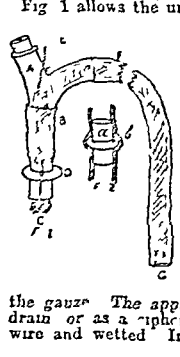

Fig. 2 shows a means I often adopted in connexion with the ordinary drainage tube. A is a metal ferrule the use of which is apparent—that is it also draws the bladder up. This should or may be bell or trumpet shaped instead of ring shaped. The withdrawal of such contrivances however causes a certain strain on the wound which is absent in the use of Fig. 1 but it is not much. The instruments are made from my working model by the Holborn Instrument Company.

I may mention whilst alluding to cycle tubes that extemporized things are often more useful in practice than specially made and expensive things—for example a part of a motor wheel inner tube tied at the lower end and strapped to the thigh makes a most efficient receptacle for urine where a permanent catheter is used. Into the end of the catheter a metal tube is passed round which the upper part of the rubber tube is tightly tied.

THE JAPANESE EARTHQUAKE

NOTES FROM KOBE ON THE MEDICAL HISTORY

BY

FREDERIC BARRETT, M.B., B.S. LOND.,

AND

G. ANDREW BIRD, M.C., M.B., B.S., B.SC. LOND.

IN Japan the term "foreigner" is applied to all races not Japanese, and it is with foreigners only that these notes deal. *The foreign community occupies a somewhat peculiar position, in that, while living in the midst of a civilization equal to that of Europe, it has retained the habit of residing for its health, and its behaviour in this crisis was no exception to the general rule.* The foreign community must be subdivided into Chinese and non-Chinese, for while non-Chinese races work and live together and run their affairs through international committees, the Chinese are self-contained and more apart from Japanese and other foreigners alike.

General Considerations

It will be remembered that the shocks occurred shortly before midday on Saturday, September 1st, 1923, that they covered a large area of country, were followed by fires and high winds, and were worst felt at Yokohama. Certain factors were favourable to a low casualty list. The women, children, and missionary population had not yet returned from the hills, and many residents were away at neighbouring health resorts for the week-end. It was an hour when most Yokohama residents were down in the settlement, and thus able to reach the sea and to avoid the fire. The s.s. *Empress of Australia* was due to leave at midday, and large numbers were down on the dock seeing off friends, and were thus able to go straight on board this vessel. On the other hand, the earthquake itself undoubtedly claimed more victims in the higher, more solid buildings of the settlement than in the wooden residences of the Bluff. None of these considerations affected the Chinese, and these unfortunate people, penned in the low lying China Town, with narrow streets and poor means of egress, were quickly surrounded by flames; their losses were appalling.

In Tokyo the shocks were not so severe, and there were comparatively few foreigners in the city at the time. Such as there were were collected mostly in the Imperial Hotel, and this structure successfully withstood both earthquake and fire. In the outlying districts there were no foreign buildings, and people were, in the large majority of instances, able to escape from houses at the first shock. Except in Tokyo and Yokohama there were no fires to contend with. There were in the harbour at the time ships of various nationalities, and it was in these that most of the refugees escaped. Land communications were for some days paralysed, and few used the roads and railways.

Organization in Kobe

The first news did not reach Kobe until the morning of September 2nd. Communications are frequently interrupted in Japan, and it was not until late in the afternoon that more accurate reports confirmed what was at first thought to be an exaggerated rumour. The extent of the casualties could only be guessed, but it was immediately apparent that the whole brunt of caring for foreign casualties and refugees alike would fall on Kobe, which is twenty-four hours' steaming from Yokohama. Shanghai, the next foreign settlement, is three and a half days by sea.

Facilities for dealing with a crisis of this nature were miserably inadequate Kobe boasted one foreign hospital, the International, and it was soon discovered that this was the only institution of the kind in working order left in Japan The hospital had 14 beds only, and was staffed by three foreign doctors—two British and one German There was also an American doctor practising in Kobe but not on the staff A foreign matron was in charge of the nursing staff, which consisted of Japanese male and female nurses Of stretchers there were only two, and these of the "wheeled" variety, and the usual time for transport of a case from the dock to hospital was three-quarters of an hour The American and German doctors happened to be away in the north of Japan and were unable to get back in time to help in the emergency Under the energetic supervision of the matron, Miss Macfarlane, supplies were collected, three additional Japanese nurses engaged, and the number of beds increased, so that by the morning of September 3rd accommodation for 32 serious cases was in readiness

The Oriental Hotel put its ballroom at the disposal of a rapidly organized relief committee, and by the morning of September 4th accommodation for about 60 walking cases was arranged here under volunteer foreign nurses A private house was fitted up as a four-bedded maternity home

The foreign community held a meeting at 4 p m on September 3rd, subscribed £5,000 within half an hour, delegated subcommittees to deal with special branches, and arranged to send a relief ship the same night to Yokohama with medical supplies and a large quantity of water The last was rightly held to be the most urgent need, and was justified on arrival by the discovery that all water mains had been broken and that a water famine was already in existence The German community, meeting independently, arranged to act in close co-operation, and assumed responsibility for ambulance transport They fitted three motor vans with improvised stretchers, and also provided better parties and drivers The personnel were ex-service men under ex-N C O s, and worked efficiently and without friction under the orders of the British doctors

Confusion on arrival of ships was anticipated by printed labels, "Hospital" and "Hotel," and whenever either of the doctors could be spared ships were met at Wada Point quarantine station and the appropriate labels affixed before the ship came into port

Arrival of Refugees

The first ship to arrive was the s s *West O'Roua*, at 1 a m on September 4th, by the night of September 8th practically all the casualties had arrived Though wireless messages were received reporting large numbers of serious cases, the actual number of stretcher cases dealt with was remarkably small Accurate statistics have not been published, and in fact are not known, but the last official report in the *Osaki Asahi Shimbun* gave the refugees arriving at Kobe by sea as 3,553 Chinese and 1,743 European By our private medical records 132 casualties were received in all—42 serious cases at the International Hospital and 90 walking cases at the Oriental Hotel Hospital

The European refugees were absorbed by the community with difficulty, the greatest problem being the Russians A certain percentage of these people might almost be termed "professional refugees," and unless carefully watched drew their rations and clothing in excess They were finally housed in the Gymnasium, it was surrounded by barbed wire and guards placed at the entrances Several cases of venereal disease were discovered among them, but these had to be isolated as well as possible in their own compound, there being no available hospital accommodation for this class of case Food supplies generally were adequate, but clothing gave rise to more difficulty

The manner in which the Kobe Chinese absorbed their own nationals and generally managed their own problems was worthy of all praise They gave the relief committee very little trouble, and looked after the questions of food and clothing without calling on outside assistance

Hospital Cases

Among the 42 serious cases admitted to the International Hospital the following nationalities were represented

British	14	American	5	Japanese	2
Russian	7	German	4	Polish	1
Chinese	6	French	2	Italian	1

The low proportion of serious cases is partially explained by various considerations The conditions following the earthquake rendered the chances of saving serious cases exceedingly slight In this connexion the heroic work of Misses Dalton and Little, matron and assistant matron of the Yokohama General Hospital, must be mentioned With the assistance of a patient they removed three helpless cases from the falling building, stayed with them all night, having to make frequent changes of position to avoid the flames, and finally succeeded in getting them to Kobe uninjured For this they received the decoration of O B E The casualties among the Yokohama doctors had been high Of the five practising, two had been killed and one sustained a compound fracture The operating theatres had been put out of action, and thus no surgical treatment was possible until Kobe was reached A certain number of deaths occurred at sea in transit

Of these cases, 28 were directly due to the catastrophe The disabilities were as follows

Traumatism	
Fractures	14
Wounds and contusions	9
Burns	3
Dislocations	2
Other Cases	
Diseases of central nervous system	3
Acute mastoiditis	1
Maternity	1
Deaths	
Head injuries	3
Pyo pneumothorax	1
Double fractured femur	1
Burns	1
Ruptured liver	1

The following are notes of some cases of interest

Case 1—R C E His left hand was crushed in the fall of a building, but he was released by the second shock He wore a tourniquet for eight hours above the elbow When admitted on September 4th he had gas gangrene of four fingers and the metacarpus of the hand An elliptical amputation was made through the mid carpus, preserving the thumb Massive septic oedema ensued, which in spite of multiple incisions down to the bone, serum and collosol silver treatment, gradually extended up the arm and finally encroached on the chest wall No pus formed until twenty seven days after the injury, when an abscess appeared in the axilla This was allowed to develop for four days, after its evacuation the temperature subsided and sepsis rapidly cleared up He has now a useful arm, including the thumb

Case 2—T B H, a man aged 65, was admitted on September 4th with commuted fracture of the right tarsus and two compound tibia fibula fractures of the same leg Gas gangrene extended three inches above the ankle Circular amputation at junction of upper and middle thirds of the leg was performed Severe secondary haemorrhage occurred nineteen days after the injury After subsequent removal of 1½ in of the tibia he recovered with a good stump

Case 3—T A a boy aged 12 Fractured pelvis tetanus This patient was of German nationality and was taken over by Professor Hattel, to whose care recovery was due

Case 4—A B a girl aged 6 was admitted on September 4th with rapid pulse, signs of free fluid in the peritoneal cavity and acute anaemia Laparotomy showed a rupture of the liver three inches in extent, plugged by clot and no longer bleeding Death occurred five hours after operation

Case 5—H T gave a history of having fallen with the second floor when the building collapsed Pain in the thigh led to x ray examination which showed a foreign body of pencil shape, of equal density to bone embedded in the mid thigh This proved to be a fragment of a knitting needle and only on being shown this did she remember that she was knitting at the time of the earthquake

Case 6—E L a woman aged 18, had contusion of the liver but recovered without operation Subsequently she developed ulnar nerve paralysis with wasting of the small muscles of the hand Scars of wounds at the elbow were explored but no nerve lesion was discovered Sensation and movement gradually returned There had been severe contusions of the shoulder and elbow, and the case was apparently one of nerve concussion

The three deaths under "head injuries" were cases indistinguishable from "shell shock" as seen in the great

war No lesions were discovered One case lived five days in a condition of complete aphasia with continuous tremors of the extremities His identity was not established 90 light cases were treated at the Oriental Hotel and 4 at the maternity home

Relief units were sent from Shanghai, Manila, Tientsin, and other places, but owing to the distances the first party did not arrive until September 7th From this date medical units poured in in expectation of a large casualty list, and by September 12th a large foreign medical organization was in working order Since casualties had occurred on one day only, work rapidly decreased, and these units, finding the Japanese had their own organization, quickly returned to their bases Medical stores were for the most part left with the Japanese and were gratefully accepted by them By the beginning of January the hospitals were emptied of its earthquake sufferers and the Oriental Hotel ballroom was again fulfilling its usual function By this time, too, overcrowding of houses was less apparent for further earthquakes in Kobe itself had finally decided many to leave the country

INCOME TAX

EXPENSES ALLOWABLE

From inquiries which reach us from time to time it would seem desirable to set out the principles which govern the position with regard to the deduction of expenses from gross receipts in somewhat greater detail than is practicable in a brief answer to a specific inquiry The legal requirement is that assessments to income tax in respect of practitioners' profits shall be made by certain local commissioners who have before them particulars of the taxpayer's declaration of income and of any supplementary information—in the form of accounts, for instance—that he may have furnished In passing it may perhaps be added that the assessment will be made by the "special commissioners" instead of the local commissioners if the taxpayer completes the appropriate blank request on the form of declaration An appeal against an assessment is determined by a different panel of the local commissioners or by the special commissioners if the assessment was made by that body or, if requested, even if it was made by the local commissioners In practice, however the inspector of taxes usually puts an assessment forward for confirmation or amendment by the appropriate commissioners and deals with any objections lodged against it The procedure has been stated because it may to some extent account for differences sometimes alleged to exist inspectors of taxes, being controlled by a central department should achieve uniformity of practice, but it is not clear that this is a necessary or in small matters even a normal, result of the action of independent commissioners, who are the final judges on matters of fact So far as our experience goes however, commissioners very rarely refuse to allow an expense if the inspector of taxes is willing to admit the claim to deduct it, and there appears to be a certain lack of uniformity with regard, at any rate to some of the minor expenses allowed

The great number of taxpayers to be dealt with and the diversity of their incomes make it difficult to secure that a system of taxation of incomes shall be reasonably proof against evasion and yet not press with undue harshness on any particular class The Income Tax Acts seek to do this by dividing all incomes into five classes or schedules, and laying down suitable rules for ascertaining the amount assessable under each schedule, income derived from property, for instance, is assessable according to the rules of Schedule A income from employment under Schedule E, and so on But the most important and also the least easy class of income to deal with is that falling under Schedule D—namely, profits and income not falling under any of the other schedules The questions which most frequently create difficulty are those which arise in connexion with the admissibility of certain deductions to be made in calculating the assessable profit

The Income Tax Acts do not lay down specific categories of expenditure to be deducted, but deal with the question by prohibiting the allowance of certain classes, and the effect of the judgements in a number of leading cases—notably that of Bruce v Ussher, Wiltshire Brewery—is that, while capital and personal expenditure must be excluded, regard may be had to well accepted commercial practice provided that the specific prohibitions are not infringed On this basis the allowable expenditure may be set out as follows

Expenditure Exclusively Professional

Salaries of dispensers including board if provided (less any sum debited to the account rent, maintenance, rates, and cost of cleaning of premises used for professional purposes wholly and partly from the business coal lighting and supplies (including board) of servants of a locum tenet or assistant cost of running a car used for professional purposes (see example) petrol oil tyres repairs and renewals wages (and board) of chauffeur replacement of medical books and instruments subscriptions for medical journals and papers and stationery used for professional accounts

Expenditure Partly from Capital Expenditure

Proportion of rent of house wholly or partly used for professional purposes and similarly for local rates cost of insuring and lighting of decorations and repairs and of attendance where a portion of the cost of these is attributable to the maintenance of the structure from the professional point of view

It is impossible to lay down any rule or formula for determining the appropriate proportions to be treated as deductible it must be fixed rather according to the facts of each individual case and is really a matter of common sense For instance where the motor car is used for private as well as for professional purposes ordinarily the mileage basis would be correct but it would be wrong to divide proportionately the cost of repairing damage caused by an accident when the car was being used definitely for one purpose or the other

The above remarks apply to the assessment of professional *profits* where a salary is concerned the position is somewhat different as allowable expenses are restricted to those incurred wholly exclusively and necessarily in the performance of the duties As an illustration of the difference we may point out that while a subscription to the British Medical Association is allowable in the case of a Schedule D assessment on profits it could be refused—and apparently with good legal justification—in the case of an assessment of a salary unless the employer required the employe to be a member of the Association as a *condition of holding the appointment*

Some time ago a departmental committee was appointed under the chairmanship of Mr Justice Powell, to consider the feasibility of simplifying the income tax forms That committee has reported, but was apparently unable *to recommend any radical simplification so long* as the present system of administration and the existing statutory code remain in force in other words *the present* complexity seems to be in the opinion of the committee, a lamentable result of applying a rigid scheme of taxation to circumstances of almost infinite complexity It is, however, to be presumed that the committee's activities have not been fruitless and that the forms used in future will be found to be more intelligible to the average taxpayer than they have been in previous years It is to be hoped so for if the expectations raised by the appointment of the departmental committee are disappointed there will be a movement towards a radical amendment of the statutes themselves the consequences of which would be more likely to benefit the astute business man than the professional practitioner

We have endeavoured here to indicate some of the general principles by which practitioners should be guided in making their returns in discussing with the inspector any objections he may raise, or in deciding to make an appeal We do not think it is possible to go further, for individual circumstances differ so much that the application of principles may often present considerable difficulties We shall continue to give definite assistance by advice to practitioners who submit specific questions, stating the full facts It would save a great deal of trouble both to inquirers and to this office were this last point kept in mind—namely, that the statement of fact should be full

Nova et Vetera.

ASSYRIAN BOTANY

MR CAMPBELL THOMPSON has long been known to Assyriologists not only as one of the most indefatigable copyists on the staff of the British Museum—for which, indeed, he edited no less than ten out of thirty-seven volumes in the series of 'Cuneiform Texts in the British Museum"—but as a specialist in Babylonian witchcraft and demonology. According to the Babylonians, devils and evil spirits were the causes of headaches, fevers, and all bodily ailments:

> "The evil spirit hath lain in wait in the desert,
> Unto the side of the man hath he drawn nigh,
> The evil ghost for ever is rampant,
> And none can resist him.
> The evil demon goeth furtively in the desert,
> And causeth slaughter among men,
> The evil devil prowleth in the city
> And hath no rest from slaughtering men.
> They smite the hero, they lay low the maiden,
> They tear the children in pieces like a leek,
> They tear out the heart."

And then the patient is described:

> "He cannot lift his limbs nor turn his side,
> He hath no desire to eat food nor drink water.
> His limbs are loosed and his body is filled with pain."[1]

The most obvious way to cure the patient, therefore, was to have recourse to incantations or charms and to sympathetic magic:

> "Fashion a figure of him in dough,
> Put water upon the man and pour forth the water of incantation,
> Bring forth a censer and torch.
> As the water trickleth away from his body may the pestilence in his body trickle away.
> Pour back these waters into a cup and pour them forth in the broad places,
> That the evil influence which hath brought low his strength
> May be carried away into the broad places,
> That the spittle which hath been spit may be poured forth like water,
> That the magic that mingled with the spittle spat forth
> May be turned back."[2]

Having studied these magical texts there is small cause for wonder that Mr. Campbell Thompson, whose father was a doctor, should go on to see to what extent the Babylonians had any real knowledge of medicine and of the medicinal value of drugs. The fruits of the first of these labours were given to the world last year, when he published his collection of *Assyrian Medical Texts, from the Originals in the British Museum*. In a note on this volume published in the BRITISH MEDICAL JOURNAL of March 22nd, 1924 (p. 538), we mentioned that it consisted of 107 plates, reproducing the text of 660 cuneiform medical tablets. Mr. Thompson recently communicated to the Section of the History of Medicine of the Royal Society of Medicine translations of some of the texts, as an example the following may be cited:

> "If a man's head has an itching . . . with oil of cedar shalt thou anoint (it)."

There is even a prescription for darkening prematurely grey hairs, for which a mixture of cypress oil and an incantation is recommended!

The medicinal use of the various herbs known to the Assyrians has been carefully investigated by Mr. Campbell Thompson and published this year in his *Assyrian Herbal*.[3] In this excellent monograph the author has been able to identify some 50 new plants and 120 minerals, and to correct a number of old translations. The sources of which he has been able to make use are primarily—(1) the medical texts, and (2) the botanical lists drawn up by the Assyrian scribes. The latter source has been chiefly of philological value, the former of practical value, for he has often been able to identify a plant from the use to which it was put by Assyrian practitioners. Another means of identification has been found in a comparison of the Assyrian drugs with those found in Greek and Roman, as well as Syrian, writers on similar subjects. In addition to this, the author has the advantage of a thorough acquaintance with the country at first hand, and a good knowledge of the plants now to be found in Mesopotamia.

An example of his method will serve more clearly to show how he arrives at his conclusions. Let us take mustard, the herb described on pages 62 and 63. In the first place, its applications are tabulated: externally, to the eyes, feet, or ears, for swelling and for coughs, used for anointing and to be bound on, especially above the lungs (that is, as poultices); internally, for the stomach, for jaundice, for singing of the ears, and the hand of a ghost! Further, "when a man's inside eats him" it is to be drunk in beer with salt, or alone in beer or water (that is, as an emetic); it also served as a mouth wash, for urinary trouble, for dyspnoea and haemorrhoids, and its root was used in toothache, it was also pounded down. It is also included in the four plants used for staining the hands (as the modern Arabs dye theirs yellow), two of the others being saffron and turmeric. To sum up: it is a common yellow drug, sometimes powdered, drunk alone or in combination with other ingredients in water as an emetic, used as a poultice for complaints of the chest and for the feet, it acts on the saliva, and its root is used for toothache. This, says Mr. Campbell Thompson, is clearly mustard, *probably Sinapis arvensis*, a plant which grows *in abundance round Mosul*. To confirm this identification the author compares the use made of mustard by other races: for example, it was used for *ὑπωπία* of the eyes (Dioscorides), while its root was chewed for toothache (Gerard), by Indians it is swallowed whole as a laxative and is also employed by them in apoplexy, convulsions, insanity, dropsy, cholera, coughs, and toothache, as well as for application as a poultice to the feet. No one will doubt that Mr. Campbell Thompson's rendering of *khaldappânu* as "mustard" is more probable than its former identification as "rhododaphne".

Other plants similarly identified are the ordinary poppy, the opium poppy, the anemone, which the Assyrians called "sheen of silver," camomile, the vetches, the mallow, and so on. Castor oil appears to have been widely used (pp. 190, 191) *for example, for the feet and ears, for swelling*, as a poultice, as a purgative, and in combination *with alkali to* make a sort of soap for washing, especially for washing the head. In Palestine to this day it is interesting to note that olive oil is used with alkali for the same purpose. Pliny, too, speaks of a soap made of tallow and ashes.

At the same time some old identifications are corrected, thus *nurmu* is translated "pomegranate" instead of *armanu*, which becomes "apricot" (pp. 176-179). This identification of *nurmu* as "pomegranate" received curious confirmation long after it had occurred to the author, a late Babylonian contract came into his hands, describing a collarette *with nurmu* ornaments, which were roughly drawn *at the bottom of the tablet by the scribe* and were clearly pomegranates. *The equation of armanu with* "apricot" is confirmed by two facts: (1) in Syriac the cognate word *'armenâyâ* means "apricot," and (2) this word must be *the* origin of the name *Prunus armeniaca*, and not the land of Armenia, for apricots cannot grow on snow-covered hills. Thus philology and botany combine to disprove the error originally made by the Romans, who mistranslated *armanu* as "Armenica".[4] The cherry also has an interesting philological history. Varro and other Roman writers state that it was imported by Lucullus into Rome from Asia Minor from a town called Cerasus, and that it received its name from that town.[5] But Mr. Campbell Thompson has no difficulty in showing (pp. 129-130) that it came from still further east and that it was known to the Assyrians under the name *larshu*, this then, proves that it was not called by the Romans *cerasus from the town of Cerasus*, but from the Assyrian *larshu*[6] further, the town was so called as being the "cherry-town"[7] *par excellence* or centre of

[4] Cp. Isidorus (*Etymologiae* XVII. vii. 7): Armeniaca autem dicitur quod primum genus ab Armenia sit advectum.
[5] Id. ib. XVII. vii. 16: *cerasus et Cerasonte urbe Ponti vocata*, but he admits that it was known in Italy before Lucullus, though hard of credible. Pliny (*Historia Naturalis* I. xiii. 30) knew that cherries were found as far east as Persia.
[6] The old derivation from the Greek *κέρας* horn must therefore be given up.
[7] The Greek name Κερασοῦς is adjectival in form and therefore derivative, and not the source of the word *cerasus*; there were two or three towns of this name on the southern shores of the Black Sea.

the cherry trade in Asia Minor Occasionally too light is thrown on obscure passages in the Old Testament Thus the Revised Version translates Leviticus xxiii, 40 "And ye shall take you on the first day the fruit of goodly trees, branches of palm trees and boughs of thick trees, and willows of the brook," etc where the words rendered "goodly trees" are literally "tree of *hadar*" in Hebrew Now the old Jewish scholars translated this "trees of citron" but modern scholars, knowing no word *hadar*, 'citron" in any Semitic language, substituted for the traditional translation 'trees of goodness"—that is, goodly trees—from the well known Hebrew *hadar*, 'splendour," honour," "ornament"—a poetical word hardly applicable to trees Mr Campbell Thompson, however, has established the fact that *adaru* (*u* being only the termination of the nominative case) in Assyrian means 'citron" (p 182), the Hebrew *hadar* is therefore cognate with and must bear the same meaning as the Assyrian *adaru*, the loss of the *h* being due to the absence of the sort *h* from the Assyrian language

Enough has been said to show the author's method, by a careful comparison of all the occurrences of a plant in literature and a study of the uses to which it was put, in conjunction with the philological information to be obtained from the cognate languages Mr Campbell Thompson who is both a scholar and a scientist has been able materially to increase the accuracy of our knowledge of the Assyrian language in a special field Although Assyriologists may occasionally hesitate to agree with his philology—and the interchange of letters in the Semitic languages is a thorny subject—all owe him a deep debt of gratitude for a thorough handling of a number of difficult problems for many years to come it is not too much to say his admirable book will be the standard work on the subject It is only to be regretted that the author could not afford to have his invaluable work printed, but was compelled to have his manuscript lithographed for, as is inevitable in such cases, there are a certain number of places where the text is, for various reasons, nearly if not quite illegible

Oxford G P DRIVER

FUR DERMATITIS

DURING the winter of 1922-3 cases of dermatitis attributed to the wearing of fur collars were observed in London and in other parts of the country In our columns of March 17th, 1923 Dr H C Semon gave an account of the symptoms, based on his experience at the Royal Northern Hospital, London, and suggested that the irritant concerned belonged to the paraphenylendiamine group of textile dyes This possibility had been previously put forward in our issue of July 1st, 1922, when a note was published in the Epitome giving an account of cases reported in the *Ugeskrift for Laeger*, April 13th, 1922, and of the use of this dye in the German fur industry which had appeared in the *Deutsche medizinische Wochenschrift*, 1913, No 49 On February 7th, 1923, Dr J H Sequeira reported to the Chief Medical Officer of the Ministry of Health that a number of patients with dermatitis of the neck and adjacent parts of the face, associated with the wearing of certain furs, were being treated at the London Hospital and at other skin clinics in London, and it was subsequently decided that an inquiry should be made into the matter, to include the investigation of complaints, the verification of the evidence incriminating certain coloured furs, and the estimation, in so far as was possible, of the character and seriousness of the skin disease The inquiry was entrusted to Dr A C Parsons, and his report[1] has now been published by the Ministry of Health

As a first step the Ministry arranged a conference with a subcommittee of the London Fur Trade Association, and communicated with dermatologists throughout the country One of these dermatologists, Dr A C Roxburgh, who was closely associated with the inquiry, contributed a brief review of this dermatitis to our columns of March 24th, 1923 (p 534), in which number, also, Dr W F Cash le described the dyeing process employed in furs Public health officers throughout the country co-operated with the Ministry, evidence was received from private individuals, and examinations of the incriminated furs were made by public analysts, the fur trade, and later, at the request of the Ministry, by Professor A G Perkins, F R S, whose observations are published in an appendix to the report

The results obtained by Dr Parsons are classed under the following headings (1) epidemiological, (2) clinical, (3) the furs in question, (4) the fault in the furs Under the first heading the outbreak of dermatitis in February, 1923, is associated with the shopping season at the preceding Christmas, 1922, and the following new years the total number of cases affected down to July, 1923, when complaints ceased, is given as about 1,000 Dr Roxburgh, in his account in the BRITISH MEDICAL JOURNAL, had indicated the existence of a definite latent period before symptoms developed, possibly due to the gradual development in the patient of a sensitiveness to the irritant Personal idiosyncrasy is stated by Dr Parsons to be certainly a factor in the determination of symptoms, which in some cases seemed to be dependent on the skin of the wearers being greasy In the great majority of cases the rash was localized to the neck and face, but occurred on the wrists when fur cuffs were worn, in rare instance it extended to the chest and arms The dermatitis usually ceased when the furs were discarded, but the cure of some patients was delayed owing apparently to the establishment of a hypersensitive condition of the skin

The furs in question were found to be those known as 'beaver-conies," the pelt for which according to the Fur Trade Association, is supplied by the rabbit In all cases the furs were dyed and it was not suggested that the hair itself was responsible for the irritation except in two cases The association was of the opinion that the furs came from abroad, and in a statement issued to its members it asserted that such furs were the product of American, Belgian French, and German dyers Dr Parsons however states that there seems to be no definite proof that English furriers can be entirely absolved, and that it was quite clear from informal discussions that the association was not prepared to answer for the innocence of British firms not members of their own body In assessing the fault in the furs Dr Parsons gives reasons for believing that the factor of personal idiosyncrasy is not paramount he discusses in detail the various dyes and processes used in the preparation of imitation furs, with special reference to the evidence of Dr W F Castle in the BRITISH MEDICAL JOURNAL, which included a list of the dyes used and the colours produced by them Dr Parsons draws attention to the interesting point that the deeper the shade produced the less likely is that particular dye to cause irritation There is said to be a difference in harmful potentialities of the various dyes and both depth of colour and harmlessness to the human skin increase with each progressive stage in the oxidation of the dye The medium shades of furs were therefore the most likely to cause trouble, and it was found actually that the dark grey and brown furs were those chiefly responsible for the complaint

In his summary and conclusions Dr Parsons points out that there is no history of any previous aggregation of cases comparable with the 1922-3 'epidemic," though sporadic cases of fur dermatitis had been reported To a less extent there was a similar outbreak in the winter 1923-4 No special localization of cases could be detected, and complaints of the same kind were made in France and Germany

Professor A G Perkins, in an appendix to the report, gives his conclusions with reserve, but draws attention to the lack of homogeneity in the colouring matter of these furs much of it was insoluble in the usual solvents, but some portions were soluble in water, some in boiling alcohol, and others in cold dilute hydrochloric acid He considers that this lack of homogeneity may have arisen from a faulty application of the dyeing process, in other words, an incomplete oxidation of the developer to the finished dyestuff The possibility of the mordanting process which results in the deposition of minute crystals of dye being injurious to health is also recognized, finally, Professor Perkins refers to the statement of Dr Castle that the colouring agent appears to dissolve in the fatty acids associated with a greasy skin

NATIONAL VETERINARY ASSOCIATION

THE National Veterinary Medical Association has met in Aberdeen this week, and some of the papers illustrate the fact that the study of the pathology and even the therapeutics of disease in the domestic mammals can throw light on questions in which the medical profession is closely concerned. We cannot pretend to give an account of all the activities of the meeting, but have picked out a few subjects of medical importance.

ANAEROBIC INFECTIONS IN ANIMALS

Anaerobic infections are not confined to man, and in a paper read during the meeting Gaiger summarized our knowledge of them in the domestic animals. *B chauvaei* is the chief organism responsible for blackquarter in cattle and sheep, but *V septique* and possibly *B oedematiens* are also implicated. The disease (*sometimes called symptomatic anthrax*) attacks especially young stock. There is a local emphysematous lesion—not always on the quarters, however—at the site of inoculation. Death, as a rule, results within forty eight hours. Methods of vaccination against the disease are now in successful use. *V septique* is responsible for equine malignant oedema, most cases of ovine and porcine blackquarter, and probably also for braxy in sheep. Malignant oedema is the equine equivalent of blackquarter in cattle. The disease is not infrequent complication of castration wounds, and is a typical gas gangrene. It may be taken as a general rule that anaerobic infections in cattle are due to *B chauvaei* with an original muscle lesion, while those in sheep are due to *V septique* with an alimentary lesion. Braxy in sheep runs a very rapid course, and death usually occurs within a few hours. It has a peculiar seasonal and geographical distribution which has not yet been satisfactorily explained. Braxy is responsible for a very large mortality in those areas where it is found—it may be as high as 35 per cent among sheep in their first winter. Gaiger reported that by means of a vaccine prepared from *V septique* he had been able to reduce the mortality to a quarter of this figure. *B welchii*, although highly pathogenic on inoculation, has not yet been recorded as the cause of any serious disease in the domestic animals. It was, of course, one of the most serious of the gas gangrene organisms of the war, and Gaiger has found it in ulcers of lamb dysentery, he has found it also occasionally in scrapie in sheep, but he is not yet prepared to state its exact significance in this direction. *B sporogenes* is a very common contamination of anaerobic cultures, and is interesting mainly on account of its therapeutic uses. It is known to veterinarians as the "Reading bacillus," and has been used to some extent in the treatment of sloughing wounds. The effects of *B botulinus* in the domestic animals are by no means fully understood. It has recently been suggested that this organism is responsible for the so called "grass sickness" of horses in this country. This disease is characterized by intestinal troubles, spasm of the throat, and muscular tremors. It is generally fatal. Gaiger holds that *B botulinus* is not the causal organism, that in general this organism is a saprophyte rather than a parasite, and that it can only be accepted as the cause of symptoms when its toxins have been formed outside the body in spoiled food.

CANINE DISTEMPER

Canine distemper is a disease of perennial interest, not only on account of its seriousness in dogs, but also because the solution of its many problems may throw considerable light on analogous diseases in man. The Medical Research Council, with the financial assistance of the *Lucas* Fund, has set on foot an investigation into the etiology of the disease, but the experiments cannot be hurried, and the results will not be available for some time. The only point of importance in the recent report (BRITISH MEDICAL JOURNAL, April 12th, 1924) was what we understood to be an expression of disbelief in the theory that *B bronchisepticus* canis was the causal organism, thus confirming the opinion held by most veterinary clinicians for many years. Meanwhile the opinions expressed by Mr Livesey will be read with interest. He gave a clinical survey of the disease, which he considers is, as of simple distemper plus many complications, the simple disease he said, shows only a rise of temperature associated with a rash on the skin or mucous membranes, a nervous disturbance, and probably a nephritis. As soon as the rash appears the fever declines. Any other symptoms are, he considers, due to secondary infections, as, for instance, by *B bronchisepticus*. Even in the uncomplicated disease convalescence is slow and tedious. He believes that infection is not, as is generally supposed, through the respiratory tract, but through the mouth. His clinical experience is that to keep the mouth of healthy young dogs clean by the use of hydrogen peroxide is the most certain method of prevention. The same treatment applied in the early stages of the disease is also the best method of avoiding complications. On account of the similarity of the symptoms to certain of the other virus diseases (such as foot and mouth disease and variola) he suggests that distemper might be treated preventively by methods similar to those used in these diseases. We understand that certain practitioners claim considerable success in the prevention of canine distemper by the use of ordinary calf lymph such as is used for variola. Livesey considers that if the complaint is diagnosed early, before it becomes complicated with secondary infections, the best treatment consists in swabbing the mouth frequently with hydrogen peroxide, feeding the animal on raw milk, and careful nursing.

NUTRITION AND DISEASE

There is a tendency to assume that disease is always—or nearly always—due to the presence of some noxious substance in the body. In many cases this is so, but Dr Orr, of the Rowett Institute, pointed out, in a paper read on September 10th, that dietetics must also play an important part in sickness and its prevention. He paid particular attention to deficiencies of minerals in diet. Calcium and phosphorus are required in greater amounts by the body than are any other minerals, and deficiency of either may lead to rickets. Iron and iodine are also essential food constituents, and their absence has serious results in the young animal. It has recently been shown that the actual proportion of these elements is important. Too much phosphorus, for example, interferes with the assimilation of calcium. Moreover, the trouble is not always confined to the affected animal, for calcium deficiency before conception may be detrimental to the developing young. Apart from the direct action of these salts, their absence is of importance in the fight between the body and invading micro organisms. In autopsies of experimental animals fed on some deficiency diet gastro intestinal lesions are very commonly found. The connexion between tuberculosis and deficient nutrition has long been recognized, and respiratory diseases are much more common in animals with an ill balanced ration. Direct evidence is tending more and more to support McCollum's dictum that "perfect food affords protection against the ravages of bacteria and other pathogenic organisms as adequately as does segregation or immunization." In the more particular application of the paper to the domestic animals, Orr points out that a growing pig may put on 2 lb of living tissue a day, a cow may secrete 12 lb of solid material daily, and a hen lay 200 eggs in a year. The importance of supplying a well balanced ration in these cases is very obvious—from both an economic and a hygienic point of view. Orr suggests that the prevalence of tuberculosis in cows may in part be due to the failure of the ration to support the enormous milk yield. Under natural conditions animals adjust their diet according to instinct. Domestication prevents this free choice, and the resulting problems of malnutrition must be faced. Information on the optimum diet is still very meagre, and there is urgent need for research to determine the requirements for all the constituents of food which are known to be essential, and the connexion between specific defects and the correlated pathological phenomena.

THE GENETICAL ASPECTS OF STERILITY

In a paper on this subject Dr F. A. E. Crew made reference to the reasons for the sterility of hybrids among the domestic animals. Two of the most interesting cases are those of the mule and the cattalo. The mule is the offspring of a cross between a male ass and a mare, the reciprocal cross of the jennet (or female ass) and the stallion produces a hinny. The hybrid is hardier, more free from disease, and more economical to keep than the parents. Both mule and hinny, however, are sterile, the few reported exception not being above scientific suspicion. The female hybrid exhibits regular oestrous periods and plentiful follicules have been found in the ovaries. In the male, however, seminiferous tubules are absent or much reduced, while there is a complete lack of functional spermatozoa and seminal fluid. It is suggested that this is due to the great difference in chromosome number in the mare and male ass. The mare has 38 chromosomes, while the jack has probably 65, which would result in the inability of the cross to produce functional gametes. The cattalo is the result of the cross between the American bison bull and Hereford or Aberdeen Angus heifer. In every case the pregnancy is complicated by severe hydramnios, and most females abort. Only about 1 in 30 produce a living calf, and among these a male is a rarity. Dr Crew considers that a sex linked lethal factor is involved. By back crossing of the females of the F1 generation with the bison or bull for several generations, hydramnios becomes less and less, and fertile males are ultimately obtained. Dr Crew explained this genetically and contended that in time dystocia, hydramnios, and sterility could be removed. He suggested also that the lethal factors might be endocrinal in nature.

GALL STONES AND CANCER.

THE constant trauma to which the lining of the gall bladder is subjected by the presence of gall stones in the cavity is, in the opinion of many, the determining cause of carcinoma in that organ. This thesis rests principally on the fact that gall stones are found to be present in the great majority of cases but the mere fact that they are sometimes absent seems to suggest that when present they play a subsidiary or predisposing and not a prime part in the production of the grave lesion. If we are to accept hospital *post mortem* statistics, the liability of a person harbouring gall stones to develop cancer of the gall bladder is by no means negligible and that liability is one of the chief arguments in favour of cholecystectomy rather than cholecystotomy but as gall stones usually give rise to little in the way of symptoms unless inflammations are superadded, the hospital figures may exaggerate the position. There are some authorities who deny to the gall stones any part—even a predisposing part—in the development of the cancer. According to them the reason why cancer of the gall bladder is so often associated with the presence of gall stones is that fragments are apt to be detached from the malignant mass and serve as nuclei around which the cholesterol in the bile deposits to form gall stones.

Much may be and has been said for each of these conflicting views without bringing us any nearer a general agreement but the simple and striking experiments of Dr. Archibald Leitch, recorded in his British Medical Association Lecture published this week (p. 451) not only support strongly the view held by the majority of clinicians as to the inciting part played by gall stones, but constitute a distinct advance in cancer research. That investigators within the last few years have succeeded in producing malignant tumours in mice or rats by some animal parasites or by the frequent application of such substances as tar has been a great step forward, and cannot be dismissed as being merely of academic interest. The results of their experiments revived the irritation theory of cancer genesis. Assiduous as these investigators have been in the exploitation of the experimental method, they have not yet been able to bring forward proofs of the truth of the irritation theory in the case of *the great bulk of human cancers* but when we are presented with cancers experimentally induced by pathological substances wholly elaborated within the human body, such as gall stones, the cogency of the argument is brought home to us, and we can appreciate the interesting developments that may be in store. The previous experiments in cancer production and especially those of Dr. Leitch and his fellow workers at the Cancer Hospital Institute seemed to indicate that the cancer producing substances are not merely mechanical irritants, but must have something special in their chemical constitution some specific stimulating property which affects the cells exposed to its action there are, indeed no very plausible examples of cancers in the human subject due to mechanical irritation. The experiments with gall stones, however, show that constant *mechanical* stimulation in certain instances can induce a malignant neoplastic reaction. The control experiments with pebbles—which we may suppose to be chemically inert, and which proved to be equally effective—conclusively dispel any lingering belief that the chemical composition of the gall stones was a factor in the production of the results.

Further interest attaches to these experiments in that this would appear to be the first time that a carcinoma of the glandular type has been produced, and the first time that a tumour has been produced in the guinea-pig. Till now the various irritants employed have brought about squamous-cell carcinoma or sarcoma, and attempts at inducing cancers of other varieties have failed. *From* this we may gather that only certain tissues of a susceptible animal are responsive to a particular type of cancer producing agent. Yamagiwa, who was *the first* experimenter to use tar, was reported to have induced carcinoma of the mammary glands in rabbits by repeated injections of this substance, but the lesions he obtained seem to have been temporary tumours of the squamous type which underwent spontaneous cure. It is the case that the guinea-pig has never been known to develop carcinoma naturally, and that attempts have invariably been unsuccessful to induce a tumour in it experimentally by the use of other substances *that have been effective* in mice, rats and rabbits, as Dr. Leitch states the results with gall stones are all the more important as they exclude several factors on which stress has been laid by the opponents of the irritation theory. The introduction of some obscure virus from without, the localization by the trauma of some supposed cancer virus *present in the economy* or the precipitation of a general predisposition to cancer would seem to be ruled out of account. On the other hand the very novelty of an induced cancer in a guinea-pig presents certain difficulties as we have no established standard with which to compare it. In man and in other animals experience has led us to associate the quality of malignance with certain characteristics—micro-scopical anatomical and clinical. In Dr. Leitch's experiments, where the evolution of the process from simple hyperplasia to invasive growth has been traced the supreme demonstration of malignancy—namely the formation of distant metastases—is wanting, but the invasion of neighbouring structures such as the liver omentum, and chest wall by the proliferating glandular elements will doubtless be accepted by everybody as sufficient proof of the malignant nature of the tumours produced.

BACTERIOLOGY AND PREVENTION OF SCARLET FEVER

FURTHER information is now available about the diagnostic possibilities in scarlet fever of the special streptococcal filtrate prepared by G. F. Dick and Gladys H. Dick to which we have drawn attention in previous issues. On May 24th (p. 924) we referred briefly to a report by Dr. A. Zingher assistant director of the Bureau of Laboratories in New York. He has now published in the *Journal of the American Medical Association* (August 9th, p. 432) a detailed account of experimental work on the Dick test carried out in normal persons and in acute and convalescent cases of scarlet fever.

The Dick test for scarlet fever is carried out in much the same way as the Schick test for diphtheria. Of a dilution of the soluble toxic filtrate from a culture

of the specific haemolytic streptococcus 0·1 to 0·2 c.cm. is injected intradermically in the right forearm for the test, and a similar amount of the heated toxin in the left forearm for the control. Positive reactions, indicated by a local area of redness, begin to appear in four to six hours, and reach maximum intensity in twenty-four hours after the injection. Thus the positive Dick test is quicker in appearing than the Schick test, which is most pronounced on the fourth day. At the end of forty-eight hours with the scarlet fever test positive reactions have faded considerably, and after a week there may be nothing but a slight pigmentation or fine scaling. When the reaction is negative no change is observed either at the site of the test or the control. The purpose of the control is to avoid confusion arising from hypersensitiveness to the protein constituents of the injected fluid. It is believed that, as with the Schick test for diphtheria, a positive reaction with the filtrate from the specific haemolytic streptococcus betrays absence of antibodies to scarlet fever toxin, and therefore susceptibility to the disease, and that a negative reaction indicates the presence of circulating antibodies, and therefore an immunity to scarlet fever.

The wide application of this test to normal persons has brought to light two considerations of great importance in the control of scarlet fever. When mothers and young infants are tested a great similarity is found in the antitoxic immunity of mother and infant, it is so pronounced as to lead to the conclusion that a definite placental transmission of antitoxic antibodies has occurred such as is known to happen for diphtheria. The infant usually retains its immunity up to the fifth or sixth month of life, and then begins to lose it. Dr. Zingher records the results of the application of the Dick test to more than 4,500 persons classified by age groups. The percentage of positive reactors rose rapidly from 44·8 per cent. in the age group 6 months and under to 70 per cent. for the group 1 to 2 years, and thereafter gradually fell. A second important fact made clear by the application of this test to the population at large is that the number of susceptible individuals is greater in higher social groups than among the less well to do. This has been established by a comparison of the percentage of positive reactors found in different types of schools and other institutions.

Turning from healthy people to acute and convalescent cases of scarlet fever, Dr. Zingher has much to say about the value of this test that will interest both the physician and the pathologist, though we must admit that his interpretation of certain irregular reactions does not clear away all the difficulties. It is possible that in the past we have been classifying more than one infection under the name of scarlet fever, it is also possible that the Dick test has not yet been elaborated to such a nicety that it will give the correct answer every time. The hundred per cent. successful type of test has too often proved a disappointment to physician and pathologist alike. But the unexpected responses to this test, remarkably few in proportion, are a field for future inquiry. They do not many complications, afford good evidence of the value and which he extract from the author's claim that the shows only a little ... Thus, every one of skin or mucous Dick test as an index of susceptibility probably a nephritis later, 7 to 28 days of illness declines. Any other symptoms are, for instance, by *B. bronchial* secondary infections, as, for instance, convalescence is slower, Even in the uncomplicated disease, tedious. He believes that infection is not, as is generally supposed through the respiratory tract but through the mouth. His clinical experience is that to keep the mouth of healthy

The Dick test has two notable practical applications—namely, for detecting susceptibility or immunity to scarlet fever, and for gauging the efficiency of active immunization with scarlet fever toxin. In previous references to this subject we have drawn attention to the value of a test which enables us to discriminate between those likely and those unlikely to contract scarlet fever. If with wider experience its claims are substantiated it will have a future as assured as has the Schick test in the control of diphtheria. The same prominence has not been given to the other practical application of this test, though it may prove useful to the science of preventive medicine. In order to render them immune to scarlet fever Dr. Zingher has injected more than 1,400 persons who gave a positive Dick reaction with scarlatinal haemolytic streptococcus toxin. The dose of this toxin for prophylactic inoculation is standardized in terms of the skin test dose. Thus for adults a quantity of toxin equivalent to 1,000 skin test doses is used for the third and final injection, but for children lesser potencies. The reactions noted have been chiefly local, consisting of redness and swelling at the site of injection, in some cases, however, some general disturbance of health has attended the injections. To avoid such complications inquiries are now being directed towards the production of a purified toxin, or toxoid, such as seems likely to be useful in active immunization against diphtheria. In new work such as this it is natural that methods should be modified repeatedly as experience is gained. The aim of this active immunization with scarlet fever toxin is to render the subject insusceptible to the disease. In practice this means converting a positive into a negative Dick reaction. As judged by these standards Dr. Zingher has achieved a moderate amount of success, for of 274 children immunized with the toxin and recently retested, 167, or 61 per cent., had been converted to the negative group, and, it is assumed, rendered insusceptible to scarlet fever.

These are the immediate practical applications of this test, but they do not by any means exhaust its significance. If such a test as this could be relied on by the clinician for the actual diagnosis of the disease it would be doubly welcome, for the clinical picture of scarlet fever is often incomplete in cases hesitatingly confined to the scarlet fever ward. It may perhaps enable us to decide whether there exists one or more than one type of scarlet fever as judged by the etiological agent, and whether the different types (if they exist) correspond to recognizable clinical varieties of the disease. The new work from which we have been quoting leads to a conception of scarlet fever which ranges it very close to diphtheria. The haemolytic streptococcus which is believed to be the cause of scarlet fever has its home within the naso-pharyngeal mucous membrane, but the presence of this microbe alone does not determine illness any more than does the presence of the diphtheria bacillus in the throat. It is the toxin which is produced by this streptococcus which, being absorbed into the system of the patient, gives rise to the rash and constitutional symptoms. Scarlet fever must be looked upon, therefore, as a combined toxic and bacterial infection. The persistent immunity which follows one attack of the disease is an antitoxic immunity. It may not be accompanied by any considerable antibacterial immunity, for the septic complications of the infection. The disappearance of the rash in scarlet fever and the return to health depend on the neutralization of the strepto-coccus toxin by newly formed antitoxin.

MEMORIAL TO SIR WILLIAM MACEWEN

Shortly after the lamented death of Sir William Macewen a committee was formed at a meeting held in Glasgow to promote a fitting memorial to his life and work. At this preliminary meeting which was attended by representatives of the University of Glasgow, of the British Medical Association by many of Sir William Macewen's old assistants and students, and by numerous members of the medical profession, an executive body representative of different interests was appointed. It has now been decided that the fund should be applied to three main purposes, in the following order: (1) The provision of a bust of Sir William, by a sculptor of eminence, with a replica for Sir William's family, it is intended that the bust shall be placed in the University. (2) The establishment of a memorial lecture, to be known as "The Sir William Macewen Lecture," to be delivered annually or biennially: it is intended that it should be not merely a memorial oration but should deal with any branch or aspect of surgical science. (3) The foundation of a Macewen medal or prize in surgery to be awarded annually, it has not been decided yet whether this shall be assigned to the class of surgery at Glasgow University or shall be given a wider application. The committee aims at obtaining a fund amounting to £3,000, and towards this about £1,000 has already been received. Further subscriptions may be sent to the honorary treasurer Mr James Macfarlane LL.D., Wesleyan Street Glasgow S.E. The chairman of the committee is Dr. A. Freeland Fergus and Dr. Archibald Young is the honorary secretary.

GRADUATION OF GLASSWARE

Some time ago a joint committee on which the British Medical Association was represented by Dr. J. S. Haldane F.R.S. was set up at the instance of the Institute of Chemistry to report on the standardization of scientific glassware. The committee in its first report, issued recently has recommended that the recognized international metric units—the *litre* (l.) and *millilitre* or thousandth part of the litre (ml.) shall be used as the standard units of volume, and that standard volumetric glassware shall be graduated in terms of these units and marked *ml.* instead of *c.c.m.* The committee has been in consultation with the National Physical Laboratory, Teddington, which has issued a revised edition of its pamphlet on tests of volumetric glassware. These tests are done in the metrology department and are of two classes. Class A tests apply to vessels intended to possess *the highest accuracy, and Class B tests to vessels* intended to possess only commercial accuracy. The pamphlet gives full particulars of the nature of the tests and of the charges made. Vessels are also graduated according to the G.W.A. unit. This is a contraction for "grams of water in air," and signifies the volume at 60° F. of a quantity of water which when weighed in air against brass weights has an apparent weight of one gram. Copies of the pamphlet and forms of application for tests to be made can be obtained on application to the Director. The joint committee points out that the success of its work must depend on the action of purchasers, it therefore urges educational authorities when purchasing volumetric glassware to specify that the apparatus must have passed Class A or Class B, or in the case of Class B is guaranteed by the vendor to comply with the National Physical Laboratory regulations. The manufacturers' representatives on the joint committee have *undertaken* to replace any article guaranteed by themselves and found not to fulfil the requirements of the National Physical Laboratory for Class B. The joint committee realizes that for teaching purposes economy in initial outlay on apparatus is a necessity, but feels confident that subject to a satisfactory demand, manufacturers will be able to supply guaranteed Class B apparatus at prices consistent with reasonable economy. The committee believes also that it will be found ultimately more economical for advanced work and research, for which apparatus of doubtful accuracy cannot be tolerated and calibration is essential to purchase tested Class A apparatus rather than to purchase untested apparatus and carry out a calibration after purchase. The committee urges that in no circumstances should orders for volumetric glassware be placed without definite limits of error being specified, as failure to do so tends to encourage the production of *inferior apparatus in which quality and accuracy are unduly* sacrificed to cheapness. Some of the cheaper calibrated apparatus is known to be so inaccurate as to lead to grave errors even in the most simple determinations. The committee believes that the simplest and most satisfactory way of specifying limits will be to refer to the National Physical Laboratory tests as indicated above.

LONDON PARKS AND RECREATION GROUNDS

The far sighted people who, even in the first half of the nineteenth century began to agitate for the preservation and extension of open spaces in London, and the acquisition of new parks and gardens as the town grew, were wise in their generation. They could point to the way in which the string of parks extending from Kensington Gardens through Hyde Park and the Green Park and St. James's Park to the Government offices in Westminster added to the freshness of the air and the amenity of life, they could fight to stop encroachments on Hampstead Heath, *and even successfully for its extension but they did not* despise small things, for much may be done with a graveyard converted into a garden: a graveyard in North Country phrase is the churchyard and the word "garth" meant and means any small enclosure immediately about a house. In addition to what has been done on a large scale many small areas ranging down to triangular pieces only a few yards square between two roads have been secured. The pioneers obtained the appointment of a Select Committee of the House of Commons which led to the passage of the Metropolitan Commons Act in 1866, *prescribing the* procedure under which the commons near London could be permanently secured. In this way Blackheath, Clapham Common, and a number of small open spaces were brought under the management of the Metropolitan Board of Works, but in 1874 the Commons Preservation Society had to fight hard with the Corporation of the City of London before Epping Forest was committed to the charge of the latter body. The London County Council, which succeeded the Metropolitan Board of Works, has obtained further powers and has used them well. It has recently issued a pamphlet one of a series of handbooks on what the Council does for London, describing London parks and open spaces. The biggest areas it manages are Hainault Forest (805 acres), saved through the initiative of the late Mr. Edward North Buxton, and purchased, with the help of the Essex County Council, the Corporation of West Ham, the District Councils of Leyton and Ilford, and private subscriptions, and dedicated to the public in 1906, Hampstead Heath, with its dependencies—Golder's Hill, Ken Wood, acquired by the Ken Wood Preservation Council and presented to the County Council this year, and Parliament Hill, northward there is Finsbury Park (115 acres), and eastward the Hackney Commons, Hackney Marsh (340 acres), and on the riverside facing Greenwich Hospital the picturesque little Island Gardens, of 3 acres, as well as many more. South of the river there is Battersea Park, of nearly 200 acres, one of the best examples of how to lay out a town park we know. It was acquired by the Government when the river

embankment was formed, and was opened in 1858, so that the planting then done is now in its best stage Not all the open spaces are controlled by the County Council, some of the most important, in or just outside the London area, are in the hands of the Corporation of the City of London, including Burnham Beeches (375 acres), Coulsdon Commons (347 acres), Epping Forest (5,560 acres), and West Ham Park (77 acres) A number of small areas are looked after by the councils of metropolitan boroughs, and in considering Greater London we must not forget Richmond Park (2,358 acres), Bushy Park (994 acres), Hampton Court Park and Gardens (820 acres), Kew Gardens (299 acres), as well as the areas quite in London, including Regent's Park and Primrose Hill (472 acres) and the Chelsea Hospital grounds (8 acres) Altogether it may be said that London is not badly off for parks and recreation grounds, and if only as serious efforts were made to cleanse the atmosphere as have been made to save open spaces it would be a reasonably pleasant place to live in It is already statistically very healthy

THE RATIONALE OF RADIATION THERAPY

In an article in the current number of the *Journal of Radiology* (August, p 296) Dr Robert Knox discusses the mode of action of radiation in bringing about the cure of certain diseases, and the nature of their effects upon cancer cells He has a good deal to say about the so-called lethal carcinoma dose, and about the importance of the indirect effects of the rays, particularly upon the blood To illustrate his thesis he uses the blood counts in a typical case of myelogenous (spleno-medullary) leukaemia, on comparing the series of counts it is seen that for a period of nearly two months following the last irradiation of the spleen the blood, on each occasion on which it was examined, definitely showed changes indicating progressive improvement, the red cells steadily increased whilst the whites as steadily diminished These changes are to be attributed not to the direct but to the indirect action of the rays Dr Knox maintains that while it is theoretically possible to administer a lethal dose to a cancer cell or to a group of cancer cells, it is practically impossible, in at any rate the large majority of cases treated clinically, to administer such a lethal dose to all the cells of a large tumour, it is essential, therefore, that the indirect effects of radiation should be studied If we are ever to deal successfully with new growths by means of radiations some other method than that of the single intensive dose must be found The suggestion, therefore, is made that the dose should be spread over a considerable period of time, by intermittent administration, so spaced out as to maintain a fairly continuous biological reaction Research is urgently needed, if the actual biological and biochemical changes induced by radiotherapy were to be discovered, a great step forward would be made towards settling the dose and method of application to achieve the control, if not the cure, of malignant growths

FREE HYDROCHLORIC ACID IN CANCER OF THE STOMACH

Great reliance has been placed on the absence of free hydrochloric acid as a diagnostic sign of carcinoma of the stomach This absence has been noted by different observers in from 77 to 90 per cent of cases, but it is generally recognized that hydrochloric acid may be absent in other conditions, and, on the other hand, that it may be present in excess even in true gastric cancer The sign, therefore, is by no means specific Since the advent of the fractional method of gastric analysis we have had more precise evidence as to the value of the finding Hartman,[1] who examined 551 cases of gastric carcinoma at the Mayo Clinic, noted achlorhydria in about half, hypochlorhydria in 15 per cent, normal acidity in 20 per cent, and hyperchlorhydria in 7 per cent In view of the fact that the histological criteria of malignancy of gastric ulcers which prevail at the Mayo Clinic have not met with uncritical acceptance amongst pathologists elsewhere, confirmation of Hartman's findings was desirable This seems to be supplied by results recently published by Friedenwald and Bryan[2] These observers collected the analyses of 100 cases of carcinoma of the stomach at all stages The localization of the growth was determined either at operation or by autopsy in 42 of these, but as far as could be ascertained the pylorus was involved in 56, the cardia in 7, the body in 21, and the growth was general in 16 Fractional analyses were made in all cases The results showed that 52 had achlorhydria, 16 had hypochlorhydria, 26 were of normal acidity, and 6 had increase of free hydrochloric acid When these figures are compared with those obtained from a single analysis after the Ewald test meal it is evident that the larger figures furnished by the latter are misleading, some free hydrochloric acid may still be present at some period during digestion when the gastric secretion is examined by the fractional method If the authors had been guided by the results of the Ewald test meal alone they would have found achlorhydria in 79 per cent of their cases, but as hardly more than half of their cases had achlorhydria when tested by the more exact method, too much importance should not be attached to the absence of free hydrochloric acid as a necessary sign of gastric carcinoma

INCOMPLETE STATISTICS

It is curious to reflect that of all the diseases that beset mankind there is hardly one on which reliable statistics are available On diphtheria there are, it is true, several carefully collected groups of figures, on syphilis there are isolated sets of figures of considerable value, likewise on malaria, cholera, and dysentery But on cancer, cardiac disease, gastric disease, renal disease, nervous disease, and the great group of non-tuberculous respiratory affections, there are, we imagine, none which a statistician can regard with favour Yet he who is interested in the treatment of tuberculosis is rapidly coming into a position in which he may weigh the value of the various hygienic, surgical, and therapeutic measures he may employ to assist the recovery of his patients This improvement in respect of tuberculosis may be attributed to three main factors In the first place tuberculous patients tend to be segregated into institutions where they can be observed by physicians whose attention is undistracted by other types of disease Secondly, there are sufficient patients in these institutions to allow of the treatment of large numbers along the same lines, and of a comparison of the results with correspondingly large numbers of cases treated along different lines And thirdly, there exists in the best sanatoriums a system of conscientious following up of the after-histories of the patients Now these are very simple reasons, and if things were better ordered there should be no real obstacle in the way of obtaining similar statistics for other diseases This is not done because under the present hospital system patients suffering from any given disease are distributed throughout a variety of institutions, where they are treated by a large number of physicians and surgeons, all working along their own individual lines There is no uniformity of distribution, there is no uniformity of treatment And as to the following up of the after histories of these patients, there has, with one or two exceptions, been

[1] *Amer Journ Med Sci* February 1922
[2] *Journ Amer Med Assoc*, July 26th, 1924 p 265

very little real attempt to touch even the fringe of the problem One remedy for this would be segregation of all cases of one disease into large institutions, where carefully controlled treatment could be applied But to this plan there are so many obvious objections apart from the administrative that there is no need to enumerate them We can see, however, no reason why every hospital should not set about following up the after histories of the patients who have been treated for certain well defined affections by certain fairly definite modes of treatment This is not so large an undertaking that it could not be carried out by a small clerical staff working under competent direction Take, for example, the surgical treatment of cancer of the breast or the stomach or the colon how many surgeons in London or other big medical centres can give reliable estimates of the expectation of life of their patients after operation? In every teaching hospital there will be found monstrous tomes of notes—taken for years and many for scores of years—dealing with the histories of thousands upon thousands of patients There they stand, neatly piled in dusty rows, filling great shelves which groan under their weight but only very rarely is any use made of them They represent potentially valuable material And if only the finishing touch were put to them if only the end results of all those cases were ascertained a mass of information of very real and lasting value would be made available to the inquirer These lugubrious reflections were prompted by the receipt of the twenty sixth annual report of the Loomis Sanatorium, New York—an institution which issues every year figures relating to the patients treated during the previous twelve months The present statistics refer to the year 1923 It is interesting to note that as regards immediate results of treatment there appears to be a correlation between the length of stay and the degree of recovery A calculation shows that whereas those patients who reached the quiescent stage were in residence for an average period of forty-eight weeks those who were discharged as arrested made a stay of sixty seven weeks This is a point of interest as not only has the same observation been made in other sanatoriums but it serves to show the importance of not attempting to hurry unduly the recovery of the patient It would be of considerable value if every sanatorium adopted the practice of publishing an annual report giving quite briefly the figures for the previous year, the number of patients admitted, the groups into which they fall and the immediate results of treatment, and every ten years they might be collected and collated, and published under the supervision of an expert statistician with a full statement of the after-histories This plan is well worthy of serious consideration

CONTROL OF PARATYPHOID EPIDEMICS

COPENHAGEN seems to be almost completely free from typhoid and paratyphoid fever and when small outbreaks occur they are not infrequently traced to the returned holiday maker, who has sought health during the summer months in a resort with bucolic standards of sanitation Tracing the sources of typhoid and paratyphoid epidemics in Copenhagen and Fredriksberg to foci of infection in the rural districts is an occupation into which the sanitary authorities in Denmark evidently enter with zest and skill, to judge from a paper recently published by a Danish medical officer of health, Dr Djorup,[1] whose tale has a moral On September 17th and 18th, 1923 two children were notified as suffering from paratyphoid B in a district in Fredriksberg which had hitherto been immune to this disease The children lived in neighbouring houses, but did not know each other Their milk supply came from the same farm, and on September 22nd a man who had consumed milk from the same source was admitted to hospital suffering from paratyphoid fever A visit of inspection to the farm showed the cowshed to be clean and the forty-five cows to be healthy looking well cared for, and well fed All the inmates of the farm were also found to be healthy But on the other side of the main road there was an insanitary, neglected old house in which the married employees and their children were accommodated by the farmer The latrines and drains were in a bad state, and tucked away in a room under a large quilt were two children who proved to be suffering from paratyphoid fever Altogether six inmates were found to be infected, and one of them was a milkmaid who had felt ill a few weeks earlier, but had continued to milk the cows morning and evening without informing her employer of her illness To make sure that the source of the paratyphoid bacilli was human only Dr Djorup had samples of milk taken from each udder of every cow but in no case could pathogenic germs be found The milking utensils having been sterilized and a new staff of milkers provided, the restrictions on the sale of the milk were withdrawn, and no further cases of paratyphoid fever occurred With this incident as his text Dr Djorup argues that official sanitary supervision of cows and their sheds gives but a partial guarantee that the milk is free from infection, so long as the workers employed in the milk trade and their families are not subjected to periodic medical inspection Of what use," he writes, "is a bi monthly inspection of the farm's stock by a veterinary surgeon so long as the farm's staff remain uncontrolled and may continue at work in spite of a variety of diseases which may be passed on to the consumer of the milk?" He calculates that medical inspection once or twice a week of the personnel on farms supplying milk ought not to add more than 1 ore (approximately a tenth of a penny) to the cost of a litre of milk, and that the benefit accruing would be greater than that following the maintenance of a definite standard for the fat content of milk But why depreciate the value of this standard to emphasize the importance of medical inspection of milkmaids?

THE WELFARE OF THE BLIND

THE annual report of the National Institute for the Blind for the financial year 1923-24 is a most interesting and comprehensive document The institute is the largest institution for the blind in the world Its work embraces the care of the blind of all ages and in every class of society It provides for the infant born blind, and for the old man and woman whose sight has failed them It assists the artisan in learning and getting suitable manual work and also the undergraduate at the university Its activities during the past year may be measured by the sum total of its budget—£193 769 At the end of last year it was faced with a very grave situation owing to a heavy financial deficit on the previous year's work This year the position is greatly bettered by the successful result of an appeal for funds so that with rigid economy it has not needed to cut down or close any of its departments—indeed, it has been able to extend them in two valuable directions A second Sunshine Home for blind babies has been opened at Southport to serve the North of England, and for old blind people a weekly new paper in Moon's type has been established The newspaper is a great boon to these old people whose blindness cuts them off from ordinary literature, and whose age prevents their learning the more difficult and complicated Braille Moon's type, invented by the late Dr Moon, is a simple variation of ordinary roman letters When these letters are embossed on strong paper they can readily be distinguished by the relatively insensitive fingers of calloused old age The large space this type fills makes

it necessary to condense the matter printed, so that little more can be given than the terse items of news that we are accustomed to see jerked out of a tape machine The report gives a reproduction of the first issue of this weekly newspaper, both in Moon's type and in ordinary print Each copy costs sixpence to produce, but is sold at twopence Over 6,000 were issued in the year The College for Blind Girls at Chorley Wood is doing well, it now has thirty pupils, and its finances are on a better footing, of a total cost of £5,000, some £3,000 is met by college fees, £1,000 by donations, and the deficit, about another £1,000, is made up out of the general funds of the institute, but last year the institute had to make up a deficit of over £3,000 This college for girls with little or no sight is the only one of its kind, it gives a first-class public school education to girls of the professional class It deserves to be better known Last year one of its pupils passed Responsions and was admitted to a college in Oxford University H R H Princess Mary (Viscountess Lascelles) is now president of the college The School of Massage is doing excellent work, by arrangement the women students are now able to attend St George's Hospital, and the men the Middlesex Hospital, for practical work Although the head office of the institute (224, Great Portland Street, London) exercises general control, there is such decentralization of activity as prevents loss of the personal touch which local endeavour furnishes, so that we find that there are branch areas and offices in Manchester, Newcastle-on-Tyne, Leeds, Sheffield, Liverpool, Leicester, Birmingham, Cardiff, Oxford, Cambridge, Exeter, Bristol, Brighton, and Southampton The report gives terse accounts of each of the several branches of its activities, together with a statement of the working expenses of each

THE QUEEN ALEXANDRA SANATORIUM FUND

THE Queen Alexandra Sanatorium in Davos was originally founded to provide sanatorium treatment in an alpine climate for persons of the English-speaking nationalities suffering from curable tuberculosis who were unable to afford the ordinary expenses of such treatment The war brought its work to an end in 1915, and in 1922 the sanatorium buildings were sold The sum of money thus realized was invested, and the interest is devoted to assisting a fixed number of selected patients to obtain sanatorium treatment at a cheaper rate during the winter months at the Hotel Frei at Davos Platz On October 14th, 1922 (p 698), we gave details of this new arrangement, which commenced in the autumn of that year The system of grants then adopted was continued in 1923-24, the amount of the grant being based on the supposition that the total weekly expenses of a patient would approximate £5, and that the grant would reduce this to about £2 10s This estimate was found in practice to be fairly accurate The number of grants was limited to twenty-eight, not only by the amount of money available, but also by the capacity of the Hotel Frei Suitable applicants receive a contribution towards the cost of board and lodging, together with the whole cost of medical treatment and nursing, for a period of about six months During this last year it was possible to continue some of the grants during the summer, and on April 30th, 1924, fifteen patients, one just admitted, were still in residence During the summer of 1923 the balconies on the south-east side of the building were covered in and converted to the loggia type, which has increased the possibility of sun-bath treatment, and, together with other improvements, has added to the comfort and convenience of the patients The annual report of the fund, which we have just received, covers the period from October 15th, 1923, when the sanatorium was reopened for the winter, to April 30th, 1924 The average duration of stay of patients was 164 days The winter was a very fine one, with abundant sunshine, offering the best possible conditions for treatment, the snowfall was about 20 feet The daily cost of each patient was approximately 16 francs, of which the patient paid 7½ francs and the fund 8½ francs The honorary secretary of the fund is Mr D Vesey, 3, Camp View, Wimbledon Common, S W 19 The visiting physicians at Davos are Dr A F Bill and Dr Florian Buel

THE LEAGUE OF NATIONS AND THE TRAFFIC IN DANGEROUS DRUGS

THE committee appointed by the Council of the League of Nations to prepare the agenda for the two conferences to be held in November next at Geneva, to which allusion was made in the JOURNAL on February 16th and April 12th, has, we understand, completed its task Last month these programmes were considered by the Advisory Committee on Opium, which will present a report thereon to the Council and Assembly of the League It will be remembered that the objectives of the two conferences to be held in November are the effectuation of Chapter II of the Opium Convention of 1912, which envisaged the gradual and effective suppression of the manufacture of and traffic in "prepared" opium, or opium used for smoking, and the restriction of the production of opium and coca leaves to the requirements for medical and legitimate purposes Some differences of opinion have, it is understood, been disclosed in the course of the deliberations The British, American, Dutch, and French members have viewed the question of restriction of output from somewhat different angles Some would attack the problem at the source—that is, the growth of the poppy and the coca shrub, others would direct attention to manufactured products, or to more effective measures for the control of national and international traffic American opinion is tending towards advocating the entire suppression of heroin, as being a drug especially resorted to in the United States by the criminal classes The attitude of the Indian Government has given rise to further criticism, but from a resolution recently passed by the All-India Congress Committee it would appear that popular opinion is coming round to the view that opium traffic for revenue must be abolished and the production of the drug restricted to medical requirements

THE BRITISH ORTHOPAEDIC ASSOCIATION'S VISIT TO ITALY

FOLLOWING a precedent set last year, when the British Orthopaedic Association held a meeting with Dutch orthopaedic surgeons at Leyden and Amsterdam, its members will visit Bologna this month, on the invitation of Professor Putti, who has arranged a programme of work at the Rizzoli Orthopaedic Institute on September 22nd and 23rd This institute comprises a very complete and extensive orthopaedic hospital, as well as workshops of various kinds Afterwards the members will travel by motor car from Bologna to Cortina di Ampezzo in order to see the Codivilla Institute there and study heliotherapy as there practised A drive among the Dolomite Mountains to Bolzano—better known by its German name of Bozen—will end what promises to be a most interesting and instructive excursion At Bolzano the train will be taken for home

SIR DAVID and LADY FERRIER celebrated their golden wedding on September 3rd Sir David Ferrier has retired from practice, but, as Sir Charles Ballance reminded us a fortnight ago, retains all his old interest in the advancement of medicine by research He is a lively proof of the saying that hard work never did anyone any harm

DR G H SIMMONS,

EDITOR OF THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION

DR GEORGE HENRY SIMMONS, who has been for twenty-five years Editor of the *Journal of the American Medical Association*, having entered his 73rd year, has intimated his wish to retire. On June 9th, during the annual meeting of the American Medical Association, he was entertained at a banquet and presented with his portrait. After the banquet a series of speeches was made.[1]

Dr Harvey Cushing

The first was by Dr Harvey Cushing, who spoke about Simmons as editor, publisher, and writer, and incidentally gave some account of Dr Simmons's career. Dr Cushing had his joke about what could be done with an Englishman if he could be caught young; for Dr Simmons was born at Moreton-in-Marsh, Gloucestershire, and went to America at the age of 18. He became a student of the University of Nebraska, and first took a degree from the Hahnemann Medical School but finding that his aspirations would not in this way be satisfied he began over again and graduated from Rush Medical College, Chicago. He practised in Lincoln, Nebraska, founded the *Western Medical Review* there and was secretary of the Medical Society of the State from 1896 to 1899, when he was appointed Editor of the *Journal* and Secretary of the American Medical Association. That Association had been founded in 1847 and its *Journal* had been established by Dr Nathan S. Davis in 1882. But neither the Association nor the *Journal* had been conspicuously successful. After Dr Simmons's appointment there was a great change. The circulation of the *Journal* went up from about 12,000 in 1900 to nearly 90,000 at the present day. It stood, Dr Cushing said, for clean journalism: not only did it begin the crusade to eliminate undesirable advertising, but through precept and example the same issue has been forced on all the other journals of the country. Once and for all it has been shown that a medical publication can be so conducted without the financial support of questionable advertising that there will be a large profit. And this surplus has been turned back into the publishing business which, under Simmons's fostering care, has grown astoundingly. Dr Cushing mentioned the publications of the American Medical Association:

A Spanish edition of the *Journal*; the *Archives of Internal Medicine*; the *American Journal of Diseases of Children*; the *Archives of Neurology and Psychiatry*; the *Archives of Dermatology and Syphilology*; the *Archives of Surgery*—much needed repositories of the more lengthy and serious scientific papers which the general practitioner has little inclination to read. And then there is *Hygeia*, the purpose of which is to disseminate health news in proper guise to the laity in place of the medicine doled out to them in lurid form in the daily press—a magazine deserving of introduction into every household. But the aims are not all. There is the *Quarterly Cumulative Index*; the Section *Transactions*; a series of useful Handbooks for the Practitioner; the publications of the Council on Pharmacy and Chemistry, the publications exposing nostrum and quackery; the publications of the Council on Health and Public Instruction; all the way from the care of the baby to those valuable papers fostered by the Bureau on the Protection of Medical Research; the publications of the Council of Medical Education and Hospitals; and much more, besides that colossal and invaluable volume of 2,500 pages now in its ninth edition—the *American Medical Directory* of over 160,000 physicians.

G. H. SIMMONS
(From a painting by Arvid Nyholm)

Summing up, Dr Cushing said that the American Medical Association has stood for definite reforms relating to the elevation of professional standards such as: (1) the establishing of State examining bodies to act as licensing boards in place of the diploma-giving schools; (2) the improvement of medical education by the raising of preliminary requirements and lengthening of the course; and (3) the regulation of pharmaceutical matters and of "patent" and proprietary medicines.

Dr William S. Thayer

Next Dr William Thayer spoke of Simmons as a man, and described him as a model of industry and persistency and equanimity and modesty and efficiency, in whose heart there lay treasured visions and ideals. Dr Thayer concluded by expressing the hope that the portrait so admirably done by Mr Arvid Nyholm would be a lasting memorial of the admiration and respect for the motives and ideals by which Dr Simmons had been guided, of gratitude for his service, and of pride in his achievement.

Dr William Mayo

Mr Hubert Work, Honorary Secretary of the Interior, followed with an appreciation, and Dr William Mayo then spoke of Dr Simmons's work for medical education. Character, he said, had made the *Journal*, and it had required character of the highest type to maintain its standards against every sort of onslaught. Graduation from a medical college, Dr Mayo said, meant commencement, though to a few members of the profession it meant the ending of scientific medicine and the beginning of a trade. Fortunately the larger number of practitioners were earnest students of medical journals. To-day, the majority of books not ephemeral in character were compilations of an encyclopaedic nature or textbooks for the student with a few highly specialized works useful only to a few. The profession as a whole kept abreast of the times by means of medical periodicals, which must be recognized as the greatest force in medical education. Nor had the education of the public in medical matters been neglected by the American Medical Association. The medical profession had been ultra-conservative and in times gone by had permitted the public to be educated by the charlatan, the quack, the patent medicine vendor, and the almanac. The United States had suffered more than any other country from insidious forms of vicious propaganda, the purpose of which had been to break down the confidence of the people at large in scientific medicine. Through the action on Propaganda for Reform in the *Journal of the American Medical Association*, and through the journal *Hygeia*, which reached the people directly, steps had been taken to restore public confidence. Even greater than these achievements had been the work of the *Journal of the American Medical Association* through its able editor in weeding out the inferior medical schools of earlier days. Such schools had been a reproach to the medical profession, they had been a source of incalculable harm to the people.

[1] Dr Simmons with characteristic self-effacement refused to allow a report of the banquet to be published in the *Journal of the American Medical Association*, and it was only by a *ruse de guerre* that the Editor of the BRITISH MEDICAL JOURNAL, being unable to accept the invitation to be present at the banquet, has been able to obtain an account of the proceedings.

at large, and had done much to cause distrust of the profession Dr Simmons had been the leader in improving medical education in the United States

A speech of personal reminiscences was then made by Mr Will Owen Jones of Lincoln, Nebraska

Dr Simmons's Reply

Dr Simmons, when he came to reply, said that words failed him to express the joy and satisfaction with which he received a gift such as the portrait and a testimonial such as the gathering When he assumed the editorship of the *Journal* the editorial, publishing, and printing departments occupied a single floor The development in these departments had been a normal growth hardly noticeable from year to year, though looming large now He had been fortunate in becoming the Editor of the *Journal* at an opportune moment The end of the nineteenth century saw the end of some of the old theories and methods of treatment and practice and the beginning of scientific medicine based on research and demonstrated facts Definite knowledge regarding the etiology and transmission of disease was taking the place of theory, pharmacology was asserting itself, drug therapy based on controlled clinical experience was taking the place of empirical prescribing The application of newer knowledge revealed by bacteriology and biological chemistry was gradually eliminating guesswork in diagnosis Naturally, the *Journal* reflected this progress

Further, the time had become ripe for reorganization of the Association, which, though originally a delegated body, had lost its representative character The reorganization of 1901 had provided a national business and legislative body—the House of Delegates—large enough to be representative, but sufficiently small to deliberate on the important questions that came before it County societies, definitely connected with the State, were created, dormant societies became active, practitioners realized that the American Medical Association was an active vital force and that they were part of it, and a new professional spirit became apparent

He had always believed and had always acted on the principle that the American Medical Association was primarily a scientific organization, with, for its chief function, the advancement of medical science and practice The reputation of the Association with the public, which was becoming better every year, was due in part to the fact that it had given evidence by its work and by its publications that it was a scientific body, and that all its efforts were for the common good of the profession and the public, and were based on altruistic motives While it was reasonable to boast of what had been done, the task, Dr Simmons said, was never-ending The Council on Medical Education had some unsolved problems, and so also had the Council on Pharmacy and Chemistry Medical legislation, which was still in a state of confusion in the United States, was a vital question The remedy lay in co-operation, and the problem now before the trustees of the Association and the Bureau of Legislation was to bring that about

The Association had resolved to take the post-graduate school to the doctor in the field, and a plan to carry out this had just been adopted It was hoped that in more than one district centre there would be within the next year ambulatory clinics, consisting of clinical and laboratory personnel, with mobile laboratory equipment available for demonstrating modern diagnostic methods and the application of rational therapeutics The funds of the Association could be expended to no better advantage, so far as the individual physician was concerned, than by thus carrying directly to him the most recent advance in the progress of medical science In conclusion, he said that while he had been fortunate in becoming connected with the Association at an opportune time, he had been equally fortunate in his associates and co-workers For twelve years, from 1899 to 1911, he had served as Secretary of the Association, as well as Editor of its *Journal*, and was, therefore, an officer of the House of Delegates During all these years, and since, he had felt that he had had the confidence and sympathy of practically all its members

England and Wales.

A New Vaccination Order

The Ministry of Health has issued a new Vaccination Order, dated August 22nd, 1924 As stated in the covering letter to boards of guardians, "The effect of the Order is to include in Form A the form of statutory declaration of conscientious objection to vaccination" In issuing the Order Mr Wheatley has gone some way to placate the anti-vaccination League, whose deputation waited on him early in the year The league naturally wanted him to go much further Some extremists, indeed, would wish Parliament to prohibit vaccination, most would accept the entire repeal of the Acts, others would be more or less satisfied with repeal of the "compulsory" provisions What he has done is merely to restore to the document issued by local registrars at registration of birth the form of declaration by complying with which exemption can be legally obtained It will be recollected that Mr Neville Chamberlain, when Minister of Health, wisely issued an Order by which the form in question was no longer handed to the parent or guardian as a matter of course at the time of registration, but had to be applied for On that point Mr Wheatley declined to reverse this administrative act of his predecessor until a year's experience had been gained Now that the year is nearly completed he has complied, and incidentally he will save the Anti-vaccination League, which appears to be very hard up, some expenditure in printing and issuing these forms on its own account, which function it adopted when Mr Chamberlain took the action stated We can believe that, as a former convener of the Public Health Committee of Glasgow, doubtless possessing some knowledge of that city's experiences of small-pox and vaccination, Mr Wheatley would feel unable to yield more than he has to the importunities of the leaguers

Since the above was written the organ of the league has published, in its September number, a letter addressed to its secretary by Mr R E Abbott, "an ardent supporter" of the cause in Gloucestershire Under date August 10th he writes

"Last week a divisional summer school of the I L P was held here, and Mr Wheatley came down for the week-end I took an opportunity of tackling him, and told him of our disappointment with the result of the deputation, particularly as he was on a list of M P s favourable to our cause He told me that that was a mistake—he had expressed himself as against vaccination, but that was ten years ago, and since then his experience on the Glasgow City Council had altered his opinion I questioned him about this experience, and all I could get was that whilst their doctors and nurses (vaccinated) never took small pox, several visiting clergymen (unvaccinated) had taken it This, plus the fact that his daughter is a doctor and has assured him that she has studied both sides fully, is all that I could get out of him He admitted to me that if there were no such laws he would require a thousand times as much evidence as he now has before introducing laws, however unanimous the medical profession might be He did not listen to statistics—merely saying that he had had too much experience of statistics not to know that figures can prove anything Further, he admitted that he was not a believer in vaccination for children, but would favour a law for compulsion for everyone in face of an epidemic Altogether I must confess I was very unpressed by his lack of imagination He did tell me that if the society pressed the matter the form would be restored and sent with the other papers"

What Mr Wheatley thinks of the league's publication of this letter, especially of the last sentence of it, at the present juncture we do not know, but if he can find time he—and other Members of Parliament subject to canvassing by the league—might usefully read the opening article in that remarkable American journal the *Saturday Evening Post* of August 23rd The title of the article is "Government by Blackmail" It has reference to political conditions in America, but appears not to be without some application to this country

WELSH BOARD OF HEALTH

In the section of the fifth annual report of the Ministry of Health which deals with Wales, it is stated that there is reason to believe that the notification of tuberculosis is steadily improving though it is still far from satisfactory During the year 1923-24 a circular was issued to every medical practitioner in the Principality, explaining clearly his obligation in this matter The several county and county borough councils have entered into agreements with the Welsh National Memorial Association, which undertakes the treatment of tuberculous persons from a national standpoint and provides also for research work, for an educational campaign, and for close co-operation between the tuberculosis physicians of the association and the local authorities in the preventive aspect of the work The present estimated net expenditure by the association for the year 1923-24 is £136,000, towards which the estimated aggregate contribution from the local authorities is £66,500 During the year residential treatment was provided at twelve hospitals and four sanatoriums, 1,331 beds in all, and dispensary treatment at fourteen central dispensaries and about ninety visiting stations Kensington Hospital (100 beds), at St Bride's Pembrokeshire, was opened during the year for non pulmonary tuberculosis in children, and considerable progress has been made in adapting and equipping a new hospital at Cefn Mably in Monmouthshire The orthopaedic after care of surgical tuberculosis cases is dealt with from three centres—the North Wales Sanatorium, Glan Ely Hospital, and Kensington Hospital, in this way a number of hospital beds are freed for new patients No new centres for the treatment of venereal disease were opened during the year, and the number of approved centres remains at ten The opening of the new out-patient department at the Cardiff Royal Infirmary has improved the facilities for treatment of venereal cases at this centre The infant death rate for Wales for 1922 was 84 per 1,000, as compared with 87 in 1921, but the maternal mortality rate shows a slight tendency to increase The number of maternity and children's welfare centres in existence on March 31st, 1924, was 234, as compared with 222 a year before Of these 13 are provided by voluntary societies and the remainder by local authorities, two of whom have also established their own maternity homes, whilst 13 authorities have arranged for the treatment in private or public institutions of complicated or necessitous maternity cases

ACCIDENT BEDS IN LONDON

As the result of an offer of assistance by King Edward's Hospital Fund for London, fourteen additional beds for accident cases have been opened at King's College Hospital This is the first result of the decision of the King's Fund, announced by H P H the Prince of Wales at the special meeting of the General Council on July 25th, to apply the legacies of the late Mr and Mrs John Wells, estimated at over £200,000, to assisting the hospitals of London with extensions, improvements, and other special needs The proposals which the Distribution Committee has under consideration are as follows

(*a*) [illegible] of additional hospital accommodation [illegible] or accident cases by grants towards capital [illegible] extension or towards the reduction of deficits on schemes of extension that have been completed or towards the opening of beds in extensions that have already been provided but are not yet available for the patients for whom they were intended

(*b*) Assistance towards schemes of improvement as distinct from schemes of extension

(*c*) Increased grants to maintenance, including the maintenance of additional beds

The Prince of Wales pointed out that 1,600 beds had been added to the hospital accommodation of London since 1913, and that the schemes now in hand or proposed amounted to another 1,000 The Wells legacies by themselves would not, he said, enable the Fund to make all the grants it would have wished to make The Distribution Committee would have to select the cases where extra help, given or promised immediately, would have the greatest effect and produce the greatest benefit to the voluntary hospital system in London Efforts made by the hospitals themselves would be taken into account so that the grants may be not only a help but also a stimulus

ILLUMINATION AT WEMBLEY

At a conference on illuminating engineering held at the British Empire Exhibition on August 12th two papers were read on the methods adopted for the illumination of the exhibition The huge amusement area is lighted by gas The similar area in the White City was lighted by high pressure gas with mantles The improvements in the use of gas now make it possible to dispense with high pressure, which is costly Standards fourteen feet high and sixty feet apart are fitted with strong lamps carrying superheaters with sixteen mantles each The nominal candle-power of each standard is 1,600 foot candles, and actual tests gave 1,590 The effect is that the light is of two to three foot-candles over the whole area so that at 10 p.m. when there is no moon it is possible to walk and even to read a newspaper comfortably throughout the area This is important, seeing that after lighting up over 96 per cent of the people in the exhibition are in the amusement area

In the exhibition proper electricity is the sole illuminant The original scheme was for flood lighting of all the fronts of the buildings from the roofs of adjacent buildings, so as to ensure that architectural features would not be distorted by defects arising from illumination from the ground level or sources at low altitude This scheme has been carried through save in some places where conditions necessitated supplementary festoon lighting Such a mode of illumination demands high power lighting and good reflecting surfaces The finest buildings are of concrete, which reflects only 25 per cent of the light, so from two to five foot-candles are required for a good effect Plaster and painted buildings require half the lighting The long distances between the buildings made concentrated beams necessary, and this has been obtained by the use of low-voltage gas-filled tungsten lamps with concentrated filaments and deep short focus parabolic reflectors, directing 76 per cent of the total luminous flux within an angle of less than 5 degrees, the highest concentration yet obtained with filament light Silvered reflectors in air tight cases are used Several thousand of these projectors illuminating facias 300 to 1,000 feet distant are in use The effect is brilliant, yet, according to Mr H T Harrison, who read a paper on the subject, there is no unpleasant glare The beautiful road standards, fashioned like a geographical globe, furnish 1 000 candle power, but since the luminous area exceeds 900 sq in there is no glare The interior lighting of some of the buildings has been effected by gas-filled lamps hung high within enamelled reflectors, these give a floor illumination of three foot-candles

Mr Leon Gaster gave accounts of two recent conferences on industrial lighting held at Geneva A paper read there by Dr Stassen on miners' nystagmus contained frequent reference to the prejudicial effects of inadequate lighting on vision The International Illumination Commission recognized that regulations for industrial lighting should be based primarily on obtaining conditions essential to the health and safety of the workers, and that the present standards should not be enforced by law But recommendations in the interest of efficient production would be welcomed Emphasis was laid upon the need of increased propaganda work

EXTENSIONS IN SURREY HOSPITALS

An extension scheme has been planned in connexion with the Croydon General Hospital, which will cost some £250,000 Sufficient money has already been collected to begin the construction of a new out-patients' department and to enlarge two existing wards this year, other new buildings contemplated include a ward block for 42 beds, reorganization of the administration block, the building of a recreation hall, with a large operating theatre above, a special block to accommodate 20 paying patients, a laboratory, and a laundry During last year 1,496 patients were treated in the wards, and 13,470 as out-patients, over 5,000 casualty cases being dealt with The extension of the Royal Surrey County Hospital, Guildford, is being continued by the enlargement and rearrangement of the existing building on the west side of the hospital to provide extra accommodation for residents, an office for the

mation, and an increase of ward accommodation to the extent of 12 beds A pathological laboratory is to be formed out of two rooms, two other rooms will be converted into isolation wards The opening of the new out-patients' wing by the Duke and Duchess of York in April last was reported in our columns of May 17th (p 880) The cost of the whole scheme, including the provision of additional endowments for maintenance, is £50,000, of which about £32,000 has been subscribed or promised, and legacies amounting to £10,650 have been allotted to this fund These extensions when completed will increase the accommodation to over 80 beds, but later on further expansion will probably be necessary It is proposed to add an additional floor to the Victoria Hospital at Woking, the new floor will comprise two wards, each containing 6 beds, and two single-bed wards A new administration block is to be erected behind the existing building, and will contain anaesthetic and sterilizing rooms, an x-ray room, accommodation for casualty cases, and rooms for the nursing staff The extension was commenced last September and is now well advanced The cost will be about £18,500, of which all but £2,700 has been raised A hospital has been erected at Carshalton, as a war memorial, on a more suitable site than that of the previously existing hospital, which it will replace The accommodation provided consists of a ward of 12 beds for women, one of 6 beds for men, 6 wards for private patients, 3 sun rooms, a maternity ward, an emergency ward, and an x-ray room The total cost of the scheme is in the neighbourhood of £20,000 A new hospital is to be built at Weybridge, with accommodation for 30 beds, at a cost of £32,000, and extensive additions are proposed at the Epsom and Ewell Hospital also

Scotland.

GLASGOW MEMORIAL TO LORD LISTER

THE statue to Lord Lister erected in Kelvingrove Park, Glasgow, will be unveiled on Wednesday next, September 17th, at 3 p m The Lord Provost of Glasgow, chairman of the Lord Lister Memorial Committee, will preside, and the statue will be unveiled by Sir Hector Cameron, C B E, M D, Emeritus Professor of Clinical Surgery in the University of Glasgow

SCOTTISH SANITARY CONGRESS

The fiftieth annual congress of the Incorporated Sanitary Association of Scotland was held last week in Marischal College, Aberdeen, under the presidency of Dr G Matheson Cullen, one of the medical officers of the Scottish Board of Health The president in his address referred to the question of the standardization of disinfectants, which he declared to be an exceedingly difficult one At present the methods employed were, he said, of a chemical nature, and the association wanted another mode of estimation by which certificates could be given as to the real values of different disinfectants in ordinary conditions of life, such as in the home, in the byre, etc Sir Leslie Mackenzie, medical member of the Scottish Board of Health, later delivered a lecture upon the outlook in preventive medicine Thirty years ago, the lecturer said, the term "preventive medicine" meant merely the application of medical ideas to the correction of bad environment This included the provision of good water supplies, good drainage, wholesome sites for houses, sufficient ventilation, clean and healthy food, and attention to the general conditions included in the nuisances section of the Public Health Act The individual, however, was left alone, except when he became a danger to others as well as to himself To-day, however, the aim of the public health movement was not merely to provide a healthy environment but to promote the best individual life The world had become conscious of crowds of expectant mothers looking for skilled direction, and crowds of tender children struggling into life and asking for more room to breathe One of the results of the war had been that in health administration the production of fitness had become an important consideration This was not the mere production of fitness for nothing in particular except to go on keeping fit, but as a working ideal for civil life It had been found by the recruiting boards during the war that out of every nine men of military age three were perfectly fit and healthy, two were on a definitely lower plane of health and strength, three could almost be described as physical wrecks, and the remaining one was a chronic invalid with a precarious hold on life These figures were enough to justify an extended programme of curative and preventive measures for several generations to come The play movement for children, the physical education movement for adolescents, and a reasonable physical care of the body for grown people—all had their proper place

DEADLOCK IN SCOTTISH HOUSING SCHEMES

The Scottish Board of Health has issued to local authorities a circular regarding the cost of houses included in tenders under the Housing Act of 1923 The Board draws attention to the progressive upward tendency of tenders for construction of houses, and suggests that, while the approval of the Board for tenders under this Act has not been necessary, concerted action should be taken to combat the rise in costs, which in its view is not justified It is pointed out that in the spring of 1924 the Board was approving tenders for flats of three apartments costing £300 for each flat, whereas in recent months the cost for similar houses has increased by 45 per cent Proposals for building under the Housing Act of 1924 will have to be approved by the Board of Health, and the Board is prepared to withhold its consent unless satisfied that the costs are reasonable It is likely that the co operation of local authorities will be forthcoming to keep down costs of building, because the State contribution is a fixed one and inflation of expenses will fall upon local authorities or their tenants A deputation from the Middle Ward District Committee of Lanarkshire was recently received by the Board in regard to this matter It was then pointed out that tenders had been received for building additional houses at prices which ranged from £351 for a two-apartment flat and £402 for a three-apartment flat to £490 for a three-apartment cottage, these costs being exclusive of land, roads, sewers, and other necessary incidental expenses The Board was unable to give its consent to the erection of houses at such prices, which in its opinion could not be justified, having regard to prices of material and labour The deputation, on the other hand, pointed out that the need for houses in the area was so great that some drastic steps would have to be taken without delay, and that every effort had been made to obtain the lowest prices for the work required

Ireland.

THE BELFAST MENTAL HOSPITAL

THE resident medical superintendent (Dr S J Graham), in his report on the *Belfast Mental Hospital* for 1923, drops the old title "District Asylum" He reiterates the call that appeared in last year's report for new and up to-date legislation "the existing statutes do not sufficiently guarantee the proper treatment of the mentally afflicted", "the Lunacy Acts require recasting to deal effectively with prevention and the incipient stages of mental diseases", "early treatment in insanity is just as important as in other forms of disease", "it seems pitiable that one of the worst forms of disease should be denied skilled early treatment, and that it is not until the mental symptoms have developed so far as to render the individual unfit to be at large that treatment commences, following certification and its present-day attendant stigma" It is well known that the Government of Northern Ireland has this need under consideration, and may be trusted, with the aid of its chief medical adviser (Dr Dawson), to redeem the lunacy laws from medieval taint To the ordinary reformer, however, and still more to the enthusiast, the parliamentary delays and procrastinations seem unpardonable, but with the distinguished medical men in the local parliament it is felt that advance is in safe hands

MEDICAL ORGANIZATION

Wicklow and Wexford medical practitioners met recently at Woodenbridge to consider the unsatisfactory position and prospects of the profession in the Free State. Dr. Hennessy, Medical Secretary, Irish Medical Committee, spoke on the Government's legislative proposals and the adverse conditions likely to occur if the profession were not immediately organized. A pledge, already adopted in Kildare and Meath, was signed by all present, binding themselves to the resignation of their offices or any other course deemed necessary by the Irish Medical Committee towards securing satisfactory conditions of medical service in Ireland.

Correspondence.

THE VALUE OF FRUIT AS A FOOD

SIR,—It has often been levelled against the profession that more attention is devoted to disease than to the prevention of it, and one has only to pick up the current number of the JOURNAL to see that the accusation is not unjustified.

In the JOURNAL of August 30th there are two examples of this doctrine. A leading article deals with an investigation into the cause of chronic ulcerative colitis. Cultures were made from ulcers found in the intestinal tract, and, as was only to be expected, large numbers of organisms were discovered and found capable of producing the disease in animals. All this is very interesting, and the result will, *of course*, be a vaccine which we shall be advised to inject into our long-suffering patients with the usual unsatisfactory results. At its best, a vaccine can only give increased resistance in a varying degree.

Why not start these investigations at the other end?—for what goes in comes out. Here are the histories of two patients in this practice.

CASE I.

A woman aged 22 was diagnosed to be suffering from ulcerative colitis, probably tuberculous and probably with more than one ulcer. Her mother stated that some time in 1920 she contracted the disease, losing her appetite, losing weight, and passing frequent blood motions. In 1921 she was sent to St. Thomas's Hospital where appendicostomy was performed and she was given irrigations of silver nitrate. Her condition improved and the improvement was maintained for some months with occasional relapses. In the summer of 1922 the appendicostomy wound had closed and the disease returned in its original severity. She became very emaciated and had frequent bloody diarrhœa. A second operation was advised but was refused. Numerous drugs including dimol and kerol were tried without success; her diet was of the usual hospital invalid variety, with slight modifications. Early in 1923 she was put upon a strict diet of raw fruit and vegetables and to-day she is fat and well.

CASE II.

A woman aged 29 had the usual symptoms of *membranous* colitis—pain in the abdomen, vomiting, anorexia and obstinate constipation, passing every few days large membranous casts of the intestines. High irrigations were given, laxatives such as paraffin and antiseptics such as dimol and kerol and drugs such as bismuth and chlorodyne, they produced little or no effect. She was fed upon such pappy foods as she could eat and her bowels were kept open with large doses of aperients. Later she was sent to the London Hospital where she received much the same sort of treatment. Later still she went to the Royal Bath Hospital at Harrogate where she had a course of Plombières treatment; her diet was at first milk, which she loathed and vomited, and it was then changed to tea, toast, eggs, and butter at her own request. During her month in Harrogate she lost 4 lb. in weight and a large quantity of membrane. However, her symptoms were alleviated and she vomited less, but was very weak and ill. On her return she was put upon a diet consisting of brown bread, butter, honey, fruit and fruit juices and began to improve straight away. Vomiting and pain ceased and at the end of the first week he had passed three well-formed motions without the aid of aperients. The membrane gradually disappeared from the motions and she is now regaining her weight.

In both these patients the gums, which were very spongy, have considerably improved since fruit was made the chief article of diet.

Turning to page 354 of the same number of the JOURNAL I read an account of *some* experiments on the effect of diet on the teeth of school children. Glancing at the diets provided, the wonder is, not that the teeth became carious, but that the investigators should spend so much time over what should be a foregone conclusion. No one could reasonably expect a child to be healthy *on* such fare. What chance have the teeth of any child on such a pap of starch and sugar, and, diversified more as a medicine with the cod-liver oil, a quarter of an orange, half a tomato, or two or three drachms of swede juice! It is also stated that the action of ultra-violet light, together with the different diets, is being investigated—why? The teeth were provided for chewing our food, and the action of an apple a day to keep the doctor away is of far more importance than the action of ultra-violet rays—to them.

Such investigations lead to nothing but expense. They start at the wrong end of the subject. Dr. Eric Pritchard, in his *Physiological Feeding of Children* (p. 22), emphasizes the importance of fruit in the diet to supply the mineral deficiencies, and any budding dietitian can see that a diet such as *any* of the three *quoted* is simply asking for trouble.

For some years both in England and on the Continent, I have been interested in child welfare work, and I have tried especially to teach the mothers the benefit of uncooked food on the digestion and teeth. If they remember nothing else they should remember that "God sent the food but the devil sent the cook." Many have a rooted objection to giving children raw fruit, on the plea that it is indigestible and too acid. It is neither if it is ripe and is chewed properly. The act of chewing slightly acid fruit stimulates the flow of saliva and cleanses the teeth and gums.

It is long since the days of Hogarth, but one has only to see his caricatures to realize that gluttony was then at its height. Were they all caricatures, those pimply, ponderous, putrefying people. We eat less in these days, *but what we feed in quantity we make up for in 'quality.'* Our food has become more "scientific." When the simpler forms of starch, sugar and meat disagree with us we call in the analytical chemist and have them predigested and *concentrated, or mixed with a suitable aperient to put* them along. Such food is practically dead to vitamins, but an excellent medium for bacteria and in the intervals of a "cure" we go about like perambulating culture tubes, prodding our windy stomachs. Small wonder that intestinal stasis, with its grisly train, soon comes upon the scene, and that from slimy mouth to protruding piles we are an easy prey.

Having arrived at this state, what do we do? Not content, we stir it up with an aperient and start all over again, perhaps with a little bismuth to cover our outraged lining, usually with milk—a fluid teeming with its own bacteria, a good constipator, and an excellent culture medium.

Raw fruits, and especially lemon juice, are the only efficient and *harmless* intestinal antiseptics and natural aperients.

On page 376 (JOURNAL, August 30th) Sir Arbuthnot Lane is reported to have read a paper on the causation of cancer, in which he urged that cancer was the result of chronic poisoning of the tissues of the body in the vast majority of cases by the poisons absorbed from the gastro-intestinal tract.

One need not be a strict fruitarian, but to the patient with fetid breath, slimy teeth, a large windy belly, epigastric tenderness and pain, and chronic constipation, *part of my advice is to drink before meals, avoid cooked* food as far as possible, eat fruit in increasing quantities until their motions are practically odourless and their bowels act easily at least once a day. The symptoms generally disappear in a few days. Indigestion is due not to the digestive organs but to indigestible food, and the various morbid conditions—constipation, dilatations, kinks, inflammations, and ulcerations—are the natural sequelae of the continued use of such foods.

The usual advice to take plenty of fresh air and exercise and to eat suitable food is not applicable to hospital patients who are confined to the wards and have to put up with the usual hospital diet supplemented by a dose of aperient *omne mane*. That this diet is a constant source of complaints by returned patients is what every general practitioner knows.—I am, etc.,

Stony Stratford, Bucks, Aug. 27th. A. H. HARGOOD

X-RAY INTERPRETATION

SIR,—Many years ago I remember listening to an enlightening and impressive lecture by the late Professor John Chiene of Edinburgh, entitled "Don't Touch" It was a plea for arriving at a diagnosis by means of the eye, a careful weighing of the symptoms, and by the use of scientific methods which involved no unnecessary manipulations of the patient He described "crepitus," as the forlorn hope of the surgeon About this time there were many surgeons who forbade the students to attend demonstrations in the x-ray department, pointing out that they relied upon a diagnosis being made by this method they would develop into mechanicians and would fail to secure that confidence in themselves which was a necessity to their advancement and the well-being of their patients

I have been led to approach you on this subject by a statement made in a letter published in your issue of August 30th, which reads as follows "Personally I am very happy to be quite sure of a simple fracture" Such a statement is, of course, very assuring to the general public, so far as the writer is concerned, but that this cannot be applied even to some of our leading surgeons it is now my intention to prove

During the last month I have seen two patients (women), both under 50 years of age, who are suffering from ununited fracture of the neck of the femur, not recognized, hence these two poor women are doomed to the greatest possible amount of inconvenience and perpetual pain for the remainder of their lives

CASE I

Five years back Mrs M was walking upon a pavement more or less slippery from a recent fall of rain She slipped, fell upon her right hip, and was unable to rise She was lifted into a taxi cab and sent home, where she was put to bed Her ordinary medical practitioner was called in, and after an examination gave it as his opinion that she was suffering only from a bruised hip, ordered her to keep her bed, telling her that she would be all right The pain was so severe during the night that she never closed her eyes, and as this did not abate during the following day the senior surgeon of one of our large hospitals was called in He made a careful examination, told the husband that the pain was due to some of the tissues having been torn, and that she would be all right after a rest in bed No attempt was made to fix the limb, neither was the patient told not to move it, as a consequence she moved it from time to time (as she did not want it to become stiff), despite the pain which ensued The limb became swollen and the pain increased to such an extent that the surgeon was again called in This time, in the night, he administered or ordered a hypodermic injection, telling the patient that the pain would go and that in a few days she would be able to get up The pain did not go although its severity diminished For five years she has been a complete invalid, always in pain, and only able to waddle about with the greatest difficulty A radiograph showed an ununited fracture, with shortening, and a large amount of callus

CASE II

Mrs N two years back slipped in the street, and being unable to rise was sent in an ambulance to the nearest hospital After being examined by several doctors she was told that she would be all right after a few days' rest, and that there was nothing serious the matter with her, she was sent home in an ambulance and put to bed Her panel doctor confirmed the hospital diagnosis No splints were applied, she was told it was better for her to move her leg After seven months in bed she hobbled again to the hospital, was given some medicine, and told to rest as much as she could Later she visited another hospital, was carefully examined, ordered more medicine, and told to have her teeth taken out Present condition ambles along with great difficulty and is never free from pain A radiograph shows ununited fracture of the neck of the femur, with a large amount of callus and some shortening

Notwithstanding the fact that twenty-eight years have elapsed since the discovery of the x rays, that it is an established fact that many fractures can only be diagnosed by their aid, and that in all fractures the necessary treatment can be better applied from the knowledge obtained through them, here are two cases in which neglect to use the most scientific means of diagnosis has resulted in the permanent disablement and condemnation to perpetual pain of two women in the prime of life, who should, had proper and scientific methods been applied, have been cured

A fracture of the neck of the femur can be diagnosed by means of the x rays with absolute certainty This being the case, may I ask what excuse can be offered why they were not used in these two cases? I have met with many cases where surgeons, holding positions which entitle the patients who employ them to consider that they are obtaining the best possible advice, have neglected to avail themselves of the benefits which accrue from the use of the x rays, and on occasion have even gone so far as to tell the patients that such a measure was useless, whilst there was at least a chance that useful knowledge might have been obtained from them Surely it is time that the jealousy engendered in the early days of the x rays should be washed out in the interest of the public —I am, etc,

JOHN HILL-EDWARDS

Birmingham, Aug 31st

SIR,—The kindly criticism of Sir Thomas Horder (BRITISH MEDICAL JOURNAL, August 23rd, p 344) seems to evade the issue, he reasserts that some radiologists give diagnoses which are not justified by the x-ray data I agree, but when he illustrates this bad habit of radiologists by quoting one of my reports I demur, for I have always taken pains to control my x-ray observations by the clinical, surgical, and pathological findings

Dr Geoffrey Fildes (August 30th, p 389) expresses the opinion that a radiologist should give no diagnoses, but merely report his x-ray observations If this is his practice I cannot agree with it Complaint is frequently made by doctors that radiologists issue reports which are too vague to be helpful In my view the radiologist should (1) describe his observations accurately, and (2) give his conclusions definitely If his facts do not lead him to a diagnosis, or do not enable him to decide between two (or more) diagnoses, he should say so definitely —I am, etc,

ALFRED C JORDIN

London, W, Sept 1st

THE PREVENTION OF MENTAL DEFICIENCY

SIR,—The papers and discussion on this subject in the Section of Diseases of Children, as reported in the JOURNAL (August 23rd, pp 316 322), although very interesting in details, do not seem helpful as to main conclusions While the experts expound theories, no doubt very necessary, are we to wait and say that nothing can be done, or is there some path along which we can all advance? I believe to day there is a great need for an authoritative pronouncement by the profession as a whole upon the methods which society should adopt to prevent mental deficiency, and that such a pronouncement would have an immediate response from all authorities concerned in social well-being

I also believe that a very general agreement could be reached upon some points Take one instance—the thorough application of the Mental Deficiency Act Probably every practitioner has known cases in which mentally deficient adolescents have been to some extent treated under this Act and then let loose, to some extent improved, but not really fit to take the responsibility of facing the world by themselves, and the result is sometimes more disastrous than if they had never been treated at all The reason for this seems to be, not that any individual has failed in his duty, but that the point of view of the administration of the Act is not always correct The State has a duty to maintain the quality of its members at as high a level as possible, and this must be done at all costs, though with the utmost care for individuals

There are other urgent matters upon which we need light, such as whether there is a permanent pauper class in our midst, and what relation has it to mental deficiency? What attitude can we adopt and what advice are we to give to people on the subject of birth control? What is the relation of venereal disease to mental deficiency? These and kindred questions are all of the greatest importance to our country at the present time and are points upon which practitioners could throw an immense amount of light —I am, etc,

NORMAN MACFADYEN

Letchworth, Aug 24th

DIET AND DENTAL CARIES

SIR,—The valuable experiments on the effect of diet on caries, recorded in your issue of August 30th, seem to me to deserve considerable attention The fact that a diet containing a small amount of easily fermented carbohydrate is liable to lodge about the teeth gives rise to a correspondingly small average number of teeth per child in which caries has spread is well shown, while where much easily

fermented carbohydrate liable to lodge is in the diet, the average number of teeth in which caries has spread is great, and where the carbohydrate is intermediate in amount, so, too, is the amount of caries This is, of course, exactly what is to be expected if the now well established theory of the cause of caries is correct It is, however, surely regrettable that this simple truth should be obscured by repeated references to calcifying vitamins Dilating on these is only misleading with regard to the experimental evidence brought forward, because, of course, the teeth affected by the different diets referred to were calcified years before the experiments were commenced

With regard to post-eruptive hardening of the enamel by the saliva, this is a physical process, and does not require us to assume the presence of calcifying vitamins Moreover, the saliva does not have the chance of exerting such beneficent action when carbohydrates lodge and ferment under conditions favouring the concentration of acid The more carefully we consider the subject the more difficult it becomes to see how calcifying vitamins can be introduced or "mobilized" through this fermenting material, even with the aid of ultra violet rays —I am, etc,

London, W Sept 6th J SIM WALLACE

PLANNING A DOCTOR'S HOUSE

SIR,—I have just gone into a new house, built under my own and the architect's suggestions for medical practice When beginning, I wished that I could have had access to one or more plans from my own point of view I write to say that, if it may help any doctor who contemplates building, the architect will be willing to submit a copy of the plan

The house has on the ground floor waiting room, dispensary and consulting room, dining and drawing rooms, upstairs four bedrooms, bathroom, w c, linen cupboard with cylinder, and a small dressing room, small lavatory inside the front door, kitchen, larder, pantry, with scullery and coalhouse inside the back door The flat roof would have taken two large bedrooms if I had wanted them

The house is built on one acre of land, two and a half miles from Scarborough —I am, etc,

Newby near Scarborough Sept 1st J P WIGHTMAN

POOR LAW PATIENTS AND FREE CHOICE OF DOCTOR

SIR,—From the letters in the BRITISH MEDICAL JOURNAL of August 30th by Dr M W Renton (p 389) and Dr T Murray (p 392) it would appear that both a slur is to be cast and an attack made on the holders of Poor Law medical appointments Speaking as a district medical officer who has held his appointment for many years, I have never once had a complaint lodged by any patient To a country practitioner such as myself, inadequate as the salary may be, it is none the less an important part of my income In fact, there are country practices where a living could not be made without these appointments What may be possible in such populated districts as Dartford, where men can obtain a much larger number of insured patients to make up for any deficiency of income, cannot or should not be applied to less populated districts Is it proposed to indemnify the present holders of district medical officers' appointments for their loss?—I am, etc,

August 30th NESTOR

IRREDUCIBLE HERNIA IN INFANTS

SIR,—In connexion with the recent correspondence on this subject it is interesting to recall the statement of Mr John Fraser in this JOURNAL (1922, i, p 177)

> I have looked over the records of 3 000 cases of inguinal hernia which have been under treatment in the Edinburgh Children's Hospital and among such a large number there has been no instance of strangulation as we find it in the adult Many of the cases have been irreducible but even in these which have been irreducible for several days strangulation had not resulted

Recently in the Bradford Royal Infirmary in a series of fifteen consecutive emergency cases of strangulated or irreducible inguinal hernia, three were in young children Their ages were 4, 11, and 18 months, and they were thus considerably older than the cases recently commented upon In all the cases irritability and crying were the first signs Vomiting was a late sign In two cases an attempt at reduction by taxis under general anaesthesia had failed All the cases were operated on within twenty four hours of the onset of the acute conditions and were discharged home healed within twelve days It was noted in all that the small bowel in the sac was not unduly congested

I suggest, therefore that in young children irreducible inguinal hernia should not be looked upon as a rarity Although realizing that there is not the same degree of constriction as in adults, it seems advisable that reduction by taxis under anaesthesia should not be attempted, but that the practitioner should arrange for immediate operation to be undertaken —I am, etc,

DAVID L McRAE TOD
Resident Surgical Officer Bradford Royal Infirmary

August 23rd.

CHRONIC ULCERATIVE COLITIS

SIR,—Your interesting article upon the etiology of ulcerative colitis (August 30th, p 378) makes reference to its well known intractability This reference prompts me to offer the suggestion, based on my own experience, that the complaint would prove less intractable, and less liable to result in extensive ulceration, if the value of Dr Wedgwood's mercury and iron mixture (see BRITISH MEDICAL JOURNAL, February 16th, 1924) were more generally recognized

I have before me a letter dated August 27th, 1924, from Dr Chillingworth of Bedford, which illustrates this point He writes to tell me of the complete success of this mixture in a severe case under his care which had been in the Samaritan Hospital, London, then in Charing Cross Hospital, where it was diagnosed as tuberculous ulceration, and "sent home by ambulance to die but who on mercury and iron "at once improved and is now quite well" —I am, etc,

T SYDNEY WILSON,
Consulting Physician Birmingham General Hospital

September 8th.

*** Dr Wedgwood's original note was published in the BRITISH MEDICAL JOURNAL in 1894, vol i (p 1126) Dr Wedgwood there stated that he had been led to use the treatment in typhoid fever on the theoretical ground that the indications might be met and the disease combated by the "internal administration of some astringent preparation of iron combined with small and continued doses of perchloride of mercury During the past two years I have treated twenty-one consecutive cases by giving max doses of tinctura ferri perchloridi with liquor hydrargyri perchloridi 3ss every four hours"

COCAINE SUBSTITUTES

SIR,—I am, of course aware that criticism is a form of flattery Nevertheless I have no intention of replying again to the letter of Mr E Watson-Williams (August 16th, p 298) because those who are interested in the matters at issue will appreciate that all the points he has again raised have been fully dealt with in my paper (BRITISH MEDICAL JOURNAL, July 12th, 1924) or in my letter in your issue of August 2nd

Mr E Watson Williams has added one original observation of his own to the discussion, and this should naturally be the most valuable part of his contribution In his letter of August 2nd Mr E Watson-Williams says "I have been using tutocain in my practice for three months but cannot find any appreciable 'shrinkage'—certainly nothing at all comparable to that produced by cocaine" Other observers, whose names I have given who have had more experience of tutocain than Mr F Watson Williams say "The shrinkage is quite definite, though less than that given by cocaine" and again "The mucous membrane and erectile tissue of the nose shrinks and pales very quickly" —I am, etc,

Pharmacological Laboratory Cambridge Sept 8th A J COPELAND

*** We cannot continue this correspondence

TUBERCULOSIS IMMUNITY

SIR,—Will you permit me to correct an error on the part of Dr Eric Pritchard as reported in the BRITISH MEDICAL JOURNAL of August 30th (p 368) in the discussion on tuberculosis in children? Dr Pritchard is reported to say:

"Dr Nathan Raw had also recently made use of attenuated cultures of the living bacillus"

My immunizing vaccine is prepared from attenuated cultures of *dead* bacilli, and I have never used living bacilli for this purpose My results with this vaccine have been so satisfactory that I have never used the other.—I am, etc,

Loughton, Essex, Sept 3rd NATHAN RAW

TREATMENT OF PUERPERAL SEPSIS

SIR,—We note with surprise that in an article by Dr Canney on the treatment of puerperal sepsis, in your issue of August 30th (p 356), he advocates the use of active exploration of the uterus in all cases as follows

"In a case showing signs of intrauterine sepsis I do not think it matters how complete the placenta, etc, may have been on inspection or to the usual tests, because no one can tell whether minute pieces may not remain Every effort should be made to remove, with the greatest care and with all possible gentleness, any detritus, however small"

We feel most emphatically that such a dangerous procedure can not only do no good but is liable to do an infinity of harm by converting a local uterine infection into a general septicaemia

The great majority of all cases of pyrexia in the puerperium resolve entirely without any treatment beyond the simplest medical measures, while the experience of all of us includes examples of the serious harm caused by unnecessary exploration of the uterus by the finger or curette

In support of our contention we submit the experience of Queen Charlotte's Hospital, illustrated by the following figures Of 3,147 consecutive cases of puerperal temperature above 100°, 2,805 cases (89 2 per cent) subsided within four days

This experience affords very strong evidence that in general it is safer to adopt an expectant attitude and to leave alone the interior of the uterus We believe that it is fundamentally unsound to interfere with Nature's defensive mechanism, particularly as the invading organisms have already penetrated into the uterine wall beyond the reach of the blunt curette In addition, the trauma of the uterine wall serves to disseminate the infection by opening new areas, as shown clinically by the frequent sequence of rigors.—We are, etc,

The Services.

THE HEALTH OF THE ARMY

THE Report of the Director General Army Medical Services for the year 1921 has just been received, and is the first of its kind published since the first half of 1914 *

Sir William Leishman, in his opening sentence, remarks that the physical standard of the army during the year under review was very much lower than that prior to the war He attributes this decline to the effects of the war on the health of those officers and men who continued to serve after the armistice, and in greater degree to the relatively poor quality of the recruits accepted to fill the places of the men demobilized In so far as comparison has been possible with the preceding year, it appears that a considerable improvement was taking place during 1921, and that a return to the high standard of 1913 was to be expected at no distant date

A statistical report of sickness incidence shows that West Africa had the highest ratio of admissions to hospital, and was followed by India and Iraq Apart from North China, where the military strength was so small as to render the ratio of little value, the death rate was highest in Iraq 10 74 per 1,000, and in India, 7 09 Malaria was responsible for the highest number of admissions, 23,893, no fewer than 18,878 of these occurring in India

In the section devoted to the medical examination of recruits, the Director General contrasts the ratio of rejections on medical examination in 1920 21 (354 01 per 1,000) with that in 1912 13 (202 50) He ascribes this large increase to the poorer physique of those presenting themselves for enlistment, and also to the fact that a large proportion of the recruits had served during the war and presented minor disabilities which, though insufficient to bar them from service in a national emergency, were grounds for rejection in the case of a voluntary army on a peace footing

The reorganization of the hygiene service of the army, planned since 1914, has been devised to link under a directorate of hygiene at the War Office the medical officers with special hygiene duties, to initiate and stimulate research into hygiene problems, thus improving the standard of army hygiene, and by the employment of specialist officers to ensure the prevention of wastage due to disease and physical inefficiency The directorate of hygiene supervises and administers the Army School of Hygiene, maintains close relations with the Hygiene Department of the Royal Army Medical College, and superintends and directs hygiene research Through the assistant directors of hygiene of commands it is kept intimately in touch with hygiene matters in the army, and is in liaison with the civil public health departments All officers R A M C receive instruction in hygiene at the College on entering the service, and again about eight years later, when attending the senior officers' course In war the following units are organized and allotted to armies in the field sanitary sections to supervise technical hygienic measures, mobile hygiene laboratories for special investigations, and trained personnel for mechanical transport water tank companies The formation of non medical "cleansing units" is under consideration

A marked reduction in the incidence of syphilis occurred in 1921 as compared with 1913, this is attributed to measures of education, prophylaxis, both recreational and medical, notification, and treatment A new directorate of pathology was established in June, 1919, and combines under a definite organization the various departments and individuals concerned, and the training of experts in all branches Officers are encouraged to specialize, and facilities are afforded for research work An advisory committee, including both civil and military experts, meets monthly to deal with problems and make recommendations It is calculated that £20,500 was saved during the year by the pathological department of the Royal Army Medical College in connexion with the manufacture and supply of vaccines and serums

In 1921 the dental treatment in the army was put on a permanent basis by the establishment of the Army Dental Corps The preservation of natural teeth is aimed at and the avoidance of the need for artificial substitutes Of the men inspected during the year in all commands 81 47 per cent required dental treatment, and of these 81 per cent received it Lectures on oral hygiene resulted in a marked improvement in the state of the mouths of newly joined recruits who had previously been unaccustomed to daily cleansing of the teeth

DEATHS IN THE SERVICES

Surgeon General Alexander Dudgeon Gulland, Army Medical Staff (ret), died at Cheltenham on September 4th, aged 91 He was born at Falkland, Fife, and educated at Edinburgh, where he graduated as M D in 1857, having previously taken the L R C S in 1854 He entered the army as assistant surgeon on June 23rd, 1854, more than seventy years ago, attained the rank of deputy surgeon general on June 14th, 1883, and retired, with a step of honorary rank, on October 1st, 1883 In the old regimental days he served in the 41st Foot, now the Welsh regiment, on the staff, in the Royal Artillery, and in the 6th Foot, the Warwickshire regiment He was in the Crimea in 1854 56, at the siege of Sevastopol, and the expedition to Kertch, receiving the medal with a clasp, and the Turkish medal, he served also in the second China war in 1860 62 in the actions at Sinho and Tanoku, the capture of the Taku forts, and the Taeping rebellion, and received the medal with clasp, he was on the North West Frontier of India, in the Hazara campaign of 1868 and received the medal with clasp General Gulland's death leaves only one medical survivor of the Crimea still living—Surgeon Major A E T Longhurst

Lieut.-Colonel John Murray, J P, R A M C (ret), died at Aberdeen on September 2nd, aged 81 He was born and educated at Aberdeen, where he graduated M B in 1864 and M D in 1884 He entered the army as assistant surgeon in 1864, and retired with the honorary rank of brigade surgeon in December 1884 He served in the 93rd Foot the Argyll and Sutherland Highlanders, in the 80th Foot, the South Staffordshire regiment, and on the staff, under the regimental system

Surgeon William Sharpe, M D, R A M C (ret), died at Bundoran on June 25th, aged 82 He was educated in the Queen's University, Ireland, where he graduated M D in 1866 and C M in 1868, and entered the army as assistant surgeon on October 1st, 1868, he was placed on half pay, on account of ill health, just ten years later He was the author of several volumes of poetry and on religious subjects *Humanity and the Man*, London 1876 *Humanity and the Serpent of Genesis*, Boston, 1888, *Man, a Special Creation, or the Preordained Evolution of Species* London, 1873 *The Cause of Alcohol, a Factor in Human Progress*, London, 1882, *Colour among Races, and the Evolution of Beauty*, London, 1873 *The Conqueror's Dream, and other Poems*, London, 1878 (third edition 1881)

Obituary

SIR WILLIAM BAYLISS, F.R.S.,

Professor of General Physiology, University College, London

THE death, on August 27th, of Sir William Bayliss, at the comparatively early age of 64, which we had the sorrow to announce in our issue of August 30th, has robbed English medical science of a leading physiologist and a great philosopher, and has taken from the scientific world a man whose profound knowledge and kindly nature had won for him universal respect and affection.

William Maddock Bayliss was born in 1860 at Wolverhampton. He was the only son of Moses Bayliss, iron manufacturer, and, being a weakly child, he was educated privately. In 1881 he entered University College as a medical student. There he worked, first under Burdon Sanderson, and later under Schäfer. He followed Burdon Sanderson to Oxford in 1883, and entered at Wadham College. While in Oxford he abandoned medicine and devoted himself to the study of pure physiology. Hence he never took a medical degree, although for the greater part of his life he worked on problems of the greatest importance for medicine. He returned to London and commenced physiological research at University College under Professor Schäfer. For the rest of his life he remained attached to University College, where he devoted the greater portion of his time to research, but where he also held a succession of teaching appointments and did a considerable amount of teaching. He finally became Professor of General Physiology at University College, an appointment that he held until his death.

Elliott & Fry, Ltd. *Maull and Fox, Ltd.*

SIR WILLIAM BAYLISS

In 1890 he commenced his scientific partnership with Professor E. H. Starling and during the ensuing fifteen years that partnership produced a series of researches of fundamental importance. The best known of these was the discovery of "secretin," the hormone produced in the duodenal mucosa, which excites the pancreas to activity. This discovery was of particular importance because it revealed a new mode by which the organs of the body could be controlled—namely, by the transmission in the blood stream of hormones, substances which are produced in one organ and carried by the blood stream to other organs on which their effect is manifested. The clear demonstration of this mechanism really formed a key with which it was possible to make a commencement at solving some of the complex problems of endocrinology. The discovery represents, therefore, one of the most fundamentally important advances in modern physiology.

Many other researches by Bayliss and Starling were of almost equal importance, among them may be mentioned the revealing of the laws governing the peristaltic movements of the intestine, at this period Bayliss also published a number of papers dealing with the mode of action of vaso-dilator nerves.

During the last twenty years of his life Sir William Bayliss devoted himself particularly to the application of physico-chemical principles, to physiological problems, and did much of the early work which established the laws governing the action of enzymes, adsorption, etc. He was particularly interested in the laws governing the behaviour of substances in the colloidal state, for he recognized very early the great importance of this subject to physiology, he was one of the chief English pioneers in the development of these researches.

Bayliss worked out experimentally the laws governing the state known as Donnan equilibrium, that he did independently of Professor Donnan, who proved them by theoretical dynamics. This law shows that when a mixture of colloids and salts is enclosed in a membrane impermeable to the former and permeable to the latter the presence of the colloids causes the concentration of the salt to be different inside and outside of the membrane. Every cell in the living body is an example of such a state, and hence this law proved to be of great and increasing importance in the study of the physical chemistry of cell.

In 1914 he brought out his great textbook *The Principles of General Physiology*. It was not merely a textbook, but rather a treatise giving the personal outlook of a master of profound learning, who had succeeded in mastering the whole of the vast field of knowledge the book covers. It has been called a "textbook for professors," but it has been very widely used by undergraduate students, although perhaps its chief importance has been due to its influence on research students.

Before this work appeared it had been assumed that the days of the great textbooks of physiology had passed since it was thought that the subject had become so vast that no one mind could master more of it than a small fraction. Bayliss's textbook, however, deals with physiology as a whole, and the more closely his work is studied the greater become our respect for the author's depth and breadth of knowledge and clearness of judgement.

During Sir William Bayliss's last illness a group of his friends and disciples under the leadership of Professor A. V. Hill undertook the preparation of a new edition of this book as a tribute to the author. Each contributor took a subject on which he had special knowledge, but even so all were surprised at the difficulty in revising even a small portion of the work, and many for the first time fully realized the extraordinary industry, knowledge, and judgement required of the author who had written the entire volume single-handed. It had been hoped to present Sir William Bayliss with the completed work, but unfortunately the book was still in the printer's hands at the time of his death.

During the war Bayliss made researches of the greatest practical value on the causation and treatment of shock. In association with Professor Cannon he demonstrated that wound shock was due to the production by injured tissues of toxic breakdown products and thus they made clear the lines along which shock might be prevented or minimized. Furthermore he studied the effects of transfusion, and showed that the reason for the inefficacy of saline transfusions in the treatment of shock was that the saline rapidly left the blood vessels. He concluded that the leakage could be minimized by the addition of a colloid of high viscosity, and for this purpose devised his well known gum saline mixture, which consists of normal saline with the addition of 6 per cent. gum arabic. This mixture was used with great success in the latter stages of the war in the treatment of shock.

geniality, and self sacrifice endeared him to a large community, and his son, who follows in his father's foot steps, has been left a difficult task

---

The tragic death of Dr ERNEST HENRY LIPSCOMB, at the age of 64, in a boating accident at Tregastel, Brittany, on August 25th, has caused deep sorrow in St Albans, with the public life of which Dr Lipscomb had been prominently associated for many years He was one of a party of five in a boat which capsized, and lost his life in an endeavour to save others He was the son of Dr J T N Lipscomb of St Albans, and was educated at the Grammar School there, at Norwich Grammar School, and at Cambridge and Guy's Hospital, he obtained the diplomas of M R C S L R C P in 1865, graduating M B, B Ch in 1869 Until 1921 he was honorary medical officer of the St Albans and Mid-Hertfordshire Hospital, and subsequently was consulting medical officer In 1893 he succeeded his father as medical officer to St Albans prison, which was taken over in 1915 by the military authorities as a detention barracks, he retained his connexion with it until it was vacated in 1919 His other medical appointments included those of certifying factory surgeon, physician to the Duchess of Marlborough's Charity, and clinical assistant to the East London Hospital for Children and Dispensary for Women He had held the office of president of the South Midland Branch of the British Medical Association For many years he had been a member of the city council, and in 1909 he was elected mayor of St Albans, an office which had been previously held by both his father and grandfather He was a prominent Freemason, a P G Deacon of the Province of Hertfordshire, and a P P Sojourner of the Province of Herts in Royal Arch Masonry In 1912 he married Miss M C Millman, who at that time was matron of the St Albans and Mid Hertfordshire Hospital, and who, with one son, aged 10, survives him

---

We regret to record the death of the widow of the distinguished physician, Dr J S Bristowe, F R S, of St Thomas's Hospital Mrs Bristowe's kindness of heart, great charm of manner, and considerable fund of humour had gained for her a large circle of friends, who will ever treasure her memory She possessed also artistic taste, and as an amateur pursued to the last her painting in water-colours, which ranked high in merit Dr Bristowe, who died in 1895, was one of the most eminent and learned physicians of his day, and his best known work, *The Theory and Practice of Medicine*, was one of the leading textbooks in this country and abroad

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

COMMISSIONERS' SCHEME

THE University Commissioners appointed in accordance with the recommendations of the Royal Commission regarding the organization of teaching in the University of Cambridge have, after considering the representations made to them, sent a memorandum to the Vice Chancellor embodying a scheme The document is divided into two part, the first dealing with the temporary steps which will be taken to introduce the faculty system and the second setting out the permanent organization proposed We will deal with the latter first

PERMANENT SCHEME

Faculties

Under the scheme which it is proposed to bring into force on October 1st 1926, there would be faculties, faculty boards and a general board of studies All fees for lectures announced by the general board of studies would be paid to the University

There would be eighteen faculties, arranged in two groups—Arts and Science In the Arts group there would be eleven faculties and in the Science group seven In the latter, however the faculty of Biological Studies would be divided into two departments, the one containing four sections and the other six The departments in the second section of the faculty of Biological Studies would be biochemistry, experimental psychology, human anatomy, parasitology, pathology, and physiology The faculties would be composed of professors, readers, university lecturers, fellows of colleges giving lectures or demonstrations, and a certain proportion of other persons appointed by the Board of the faculty

Medicine would be one of the faculties in the Science group It would consist of teachers who come within one of the classes above mentioned, and give instruction in medicine, surgery, pharmacology, anatomy, biochemistry, physiology, or pathology, or give courses in physics, chemistry, or biology for medical students

The Faculty Boards would consist of the professors, a certain number of members of the faculty elected by it for a period of four years, a certain number of persons nominated by the council of the Senate for a period of two years, a certain number nominated by the Board, and in certain cases representatives of cognate studies

The Faculty Board of Medicine would consist of the Regius Professor of physic, the Downing professor of medicine the professors of anatomy, biochemistry pathology, and physiology, four members of the faculty elected by it, and two persons nominated by the council

General Board of Studies

The suggestion of the commissioners is that the general board of studies should consist of the vice chancellor, four members each of the groups of arts and science faculties respectively, four members of the council of the Senate and two persons not members of the council of the Senate elected by the University for four years It is proposed to transfer the present duties of the General Board in regard to the awarding of the higher degrees to the Board of Post Graduate Studies

University Lectureship

The commissioners make certain regulations for university lectureships (including demonstratorships) Lecturers would be appointed by a standing committee separately constituted for the faculty or department This committee would consist of the vice chancellor the head of the department, three members of the board of the faculty, and two persons nominated by the General Board

Tenure—Appointments would as a rule be made in the first place for three years, but on reappointment tenure would be for so long as the lecturer continued satisfactorily to perform the duties of his office until the retiring age The Faculty Board is to ensure that professors readers and lecturers continue to perform the duties of their office satisfactorily

Work and Salaries—The passage from the report under this head is as follows

> The Commissioners think it will be impossible to ensure absolute equality between the conditions of work and remuneration in the various faculties Their present opinion is that there should be a basic amount of teaching work obligatory upon a University Lecturer—namely not fewer than thirty-two or more than forty-eight hours of lecturing during the year The the initial basic salary in respect of such amount of work be not less than £160 That the General Board should have authority to vary in specific cases the requirements as to the basic amount of teaching work That each Faculty should have a scale of increments in the basic salary to be approved by the General Board and that other payments in addition to the basic salary should be made in consideration of work done in addition to the basic amount of work That Boards of Faculties should have power to make a maximum additional payment of £250 a year to a University Lecturer who is not a Fellow of a College That the payments to be made to University Lecturers in addition to the basic salary should be determined by the Faculty Board concerned and made from Faculty or Departmental Funds The funds will consist of (1) fees for lectures including lectures given by professors and readers (2) contributions from the chest

Retiring Age—The commissioners recommend that the retiring age for all members of the university teaching and administrative staffs shall be 65, but contemplate that the General Board would have power to continue a professor in office for a period not exceeding five years—that is, until he attains the age of 70

Position of Women in Relation to Teaching

The commissioners contemplate that the statutes will be so framed as to render women eligible for professorships, readerships, universities lectureships, and examinerships, subject to the reservations made by the Royal Commission Fellows of women's colleges will be eligible to become members of faculties

TRANSITIONAL ARRANGEMENTS

The University will have to decide at the outset which of the existing lecturers of varying seniority in each faculty it is prepared to take on the permanent university establishment, and will have to make a separate bargain with each such lecturer It is proposed, therefore, that the University should before July 1st, 1926, make appointments to university lectureships in each faculty, to take effect on October 1st, 1926 The council of the senate would nominate an appointing committee for each faculty, which would make its recommendations at the

hospital There is a complete list of the days and times of attendance of the medical and surgical staffs The names of old students are arranged in two lists—the one alphabetical and the other according to locality In the alphabetical list there are given the date of entry the qualifications and distinctions and the address of each individual together with a summary of his scholarships posts held while at the hospital, and present appointments The local list is followed by lists of medical officers of the naval, military, and Indian services, of past and present officers of the hospital and medical school, and of scholars and medallists There is also a record of old students who have died since the last publication of the book The editor, Mr Robert Hopkins is to be congratulated on having produced the best old students list that we have seen

THE next half yearly election for the admission of fatherless children to the Royal Infant Orphanage Wanstead, E 11, will be held in November Children under 7 years of age are eligible, and applications for information and nomination papers should be addressed to the Secretary at the Orphanage at once

THE freedom of the city of Warsaw where she was born and received her early education, has been conferred on Madame Curie

THE King has granted Dr Charles Todd, O B E, technical expert to the Egyptian Department of Public Health permission to wear the insignia of the Second Class of the Order of the Nile conferred upon him by the King of Egypt in recognition of valuable services rendered

THE international congress on industrial hygiene, held at Geneva in July, attracted some thirty doctors and others interested from Europe, America and Japan Professor Leonard Hill's paper on ventilation and the value of the kata thermometer was read by Dr Wyatt owing to the indisposition of the author Other questions considered were fatigue tests, the application of methods of illumination in workshops and miners nystagmus

THE annual general meeting and conference of the Institute of Industrial Welfare Workers will be held at The Hayes Swanwick Derbyshire, from September 26th to 29th The subject of the conference will be The doctor and the psychologist in industry On September 27th Dr C S Myers Director of the Institute of Industrial Psychology will speak on the subject of "What psychology can do for industry and will be followed by Dr W F Dearden honorary secretary of the Association of Certifying Factory Surgeons who will deal with the subject of "What medical science can do for industry In the evening of the same day The psychological and physiological aspects of accident prevention will be discussed by Dr Millais Culpin and Dr H M Vernon Investigator for the Industrial Fatigue Research Board Further information may be obtained from the conference secretary, Miss N J Kessler, West Lynn, Altrincham, Cheshire

THE annual general meeting of the Medical Sickness, Annuity and Life Assurance Society Ltd, will be held at the offices of the company Lincoln House, 300, High Holborn, W C 1, on Monday October 6th at 4 p m

ST LUKE'S INTERNATIONAL HOSPITAL in Tokyo has received 150 000 yen (over £13 000) from the Japanese Home Department to provide additional equipment This money comes from the fund raised by the Japanese Red Cross Society after the earthquake in September last year, and is given in view of the work carried on by the hospital among the necessitous and also in consideration of the fact that the hospital buildings were destroyed at that time

THE annual exhibition of the Royal Photographic Society of Great Britain will be opened at 35 Russell Square, W C 1, to-day (Saturday, September 13th) at 3 p m by the president, Mr J Dudley Johnston The memorial to Henry Fox Talbot will be unveiled by Dr G H Todman The exhibition will remain open until Saturday, October 25th

In *Vital Statistics of Non Native Officials* published by the Crown Agents for the Colonies at 4, Millbank S W 1, price 6d, an account is given of the statistical returns for 1923 The invaliding rate shows a slight improvement on that of the previous year, though an increase in the death rate occurred

THE *Journal of Nervous and Mental Diseases* of New York proposes to celebrate its fiftieth anniversary this year by the publication of an index to its fifty volumes

THE fourth congress of the French Association of Pediatrics will be held in Paris from September 29th to October 1st inclusive, under the presidency of Professor Marfan The subjects to be discussed include the etiology and pathology of rickets, the prophylaxis and treatment of congenital syphilis, and the treatment of purulent pleurisy in infancy

WE regret to learn of the death, on September 9th, of Dr R J Farman, secretary of the London Panel Committee

IN compliance with the resolution adopted by the House of Commons before the adjournment, the Minister of Health has appointed a committee under the chairmanship of Sir Ernest W Moir, M Inst C E, to inquire and report as to new materials or methods of construction of houses for the working classes and to make recommendations as to the organization required for securing the adoption and use of approved new materials or methods by local authorities and other bodies or persons providing such houses The members of the committee include architects and engineers, persons interested in local administration, and representatives of master builders and operatives, as well as of the Ministry of Health and Office of Works

DR J S HALDANE, F R S of Oxford is the new president of the Institute of Mining Engineers and will be in the chair at the annual meeting, which is to begin at Wemble, Exhibition on October 2nd He is director of the mining research laboratory in the University of Birmingham and his researches on the safeguarding of health in mines are well known

DR ETHEL BENHAM has been nominated by the Minister of Health to be a member of the Metropolitan Asylums Board

WE regret to record the death, on September 6th, at the age of 83, of Sir Frederic Needham, who had been associated with lunacy administration all his life and was appointed a member of the Board of Control in 1892 We intend to give some account of his career in our next issue

THE Council of the Royal Sanitary Institute has accepted the invitation of the city of Edinburgh to hold a congress and exhibition there next year (July 20th to 25th)

MR JOSEPH BRIGGS has given £1 000 to the Bradford Royal Infirmary to name a bed in memory of his wife and other deceased members of his family

THE late Mr Frederick Fountain bequeathed to the Miller General Hospital for South East London a house known as Cedar Bank, to be used as a convalescent home, and £12 000 as an endowment for its upkeep Sir James and Lady Carmichael have given £10 000 towards the cost, estimated at £20 000 of erecting the William Shepherd Memorial Wing at the Bolingbroke Hospital Wandsworth Common Under the will of the late Mr Walter John Tillett shipowner of Penarth, the Cardiff Royal Infirmary receives £10 000 the income from which is to be devoted, first to the maintenance of the Elizabeth Tillett bed in memory of his wife, and subject thereto for the general purposes and upkeep of the infirmary

Letters, Notes, and Answers.

THE telephone number of the BRITISH MEDICAL ASSOCIATION and BRITISH MEDICAL JOURNAL is Gerrard 4630 (Internal Exchange) The telegraphic addresses are

EDITOR of the BRITISH MEDICAL JOURNAL *Articulate Westrand, London*

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisement etc) *Articulate Westrand London*

MEDICAL SECRETARY *Medisecra Westrand London*

The address of the Irish Office of the British Medical Association is 16 South Frederick Street Dublin (telegrams *Bacillus Dublin* telephone 4457 Dublin and of the Scottish Office 6 Parliament Square Edinburgh (telegrams *Associate, Edinburgh* telephone 4361 Central)

QUERIES AND ANSWERS.

"ANXIOUS" asks for advice in the selection of a battery for zinc ionization in ear cases He has not found dry cells a success and has plenty of room at his command.

MUSHROOM POISONING

DR W B WANCHOLTH (Taunton) writes This morning a patient of mine gathered a large basket of mushrooms which his family divided with the next door neighbour In one case the stalks were removed before cooking and no ill effects followed the meal in the other household the stalks were cut through and part of them were eaten these people (three) suffered from acute vomiting and diarrhœa but all the symptoms passed off in a few hours What is the explanation? Does the stalk of the mushroom contain a poison which is not present in the mushroom itself? I have looked up *Mrs Leeton* and her instructions with regard to the preparation of mushrooms is to peel the top and cut off a *portion* of the stalk" A possible explanation might be found in the cooking

THREADWORMS

DR WILLIAM COBBETT (Worthing) writes in response to J E V's request (August 30th p 391) for suggestions in the treatment of a stubborn case of threadworms Has he by chance tried the effect of garlic which has given me excellent results? I should suggest the nightly injection into the empty bowel through a

end of Lent term, 1926, as to the initial number of university lectureships in each faculty, the persons to be appointed, and the terms of appointment

THE NEW INSTITUTE OF PATHOLOGY

We announced on January 26th (p 163) the acceptance by the Senate of the University of Cambridge of the offer of the Board of Trustees of the Rockefeller Foundation to endow the School of Pathology in the University The trustees offered £100,000 for the building of a pathological institute and its general maintenance, and to contribute £33 000 towards its endowment, the University undertaking to find an equal amount for the completion of the endowment In response to an appeal by the University authorities, Mr Ernest Gates, of Old Buckenham, Norfolk, has now promised to give this sum in memory of his wife Mr Gates is managing director of Salts (Saltaire), Ltd , and a director of other Bradford wool manufacturing firms

UNIVERSITY OF LONDON

Parliamentary Election

THERE is a vacancy in the parliamentary representation of the University, there are three candidates—Sir John Rose Bradford, nominated by the Unionist Association Professor A F Pollard by the Liberal Association, and Dr E Graham Little by the Graduates' Association as a non political candidate The date of the election has not yet been fixed The total number of graduates does not seem to be stated in the *Calendar*, but at a rough estimate it is between 13,000 and 14 000 At the general election in 1922 the total poll was 7,440 and the late Sir Sydney Russell Wells was returned with a majority of 1 663 At the general election in 1923 the total poll was 8 050 the figures being Sir Sydney Russell-Wells (Conservative) 4,037, Professor A F Pollard (Liberal) 2,593, Mr H G Wells (Labour Socialist) 1,420

Every graduate who complies with the conditions prescribed in the Representation of the People Act, 1918, is entitled to be registered as a parliamentary elector on making a claim and paying a fee of £1, which also covers life membership of convocation No further fee is required from graduates who are already life members of convocation

A Departmental Committee

The President of the Board of Education, on August 29th, announced that the reference to the Departmental Committee on the University of London which he has decided to appoint is as follows

"To consider the Final Report of the Royal Commission on University Education in London dated March 27th, 1913, and, having regard to present circumstances and after consultation with the persons and bodies concerned, to indicate what are the principal changes now most needed in the existing constitution of the University of London, and on what basis a statutory commission should be set up to frame new statutes for the University"

The constitution of the Committee was not complete

Medical News.

THE Melbourne Permanent Committee for Post Graduate Work offers a prize of 150 guineas for the best essay on the causes and prevention of maternal morbidity and mortality The essay should include discussion of the following problems the teaching of obstetrics to students, graduates, and nurses, hospital conditions, control, and staffing, the conduct of private obstetric practice, and ante natal supervision Throughout the essay attention should be chiefly given to the prevention of maternal morbidity This competition is open to members of the British Medical Association registered in the Commonwealth of Australia The essays should be typewritten, and must be delivered to the honorary secretaries of the Post Graduate Committee at 12, Collins Street, Melbourne, on or before May 1st, 1925 The prize essay will become the property of the committee, and provided that the committee so approves, it will bear the expense of publication Each essay must have a motto or device placed upon it, and be accompanied by a sealed envelope with the name and address of the author inside, but having on the outside the same motto or device

PROFESSOR PAVLOV'S seventy fifth birthday is to be celebrated at Leningrad on September 27th by the publication of a "Festschrift" in the form of a special number of the *Archiv biologitscheskich Nauck* (Archives of Biological Sciences), which is the official organ of the Institute of Experimental Medicine

THE Lord Mayor of Liverpool on September 4th unveiled at Leasowe Hospital for Crippled Children a tablet to the memory of Mr G P Newbolt, F R C S , first chairman of the hospital It will be remembered that a committee has been formed to establish a memorial to Mr Newbolt at the Royal Southern Hospital, Liverpool to which he was surgeon down to the time of his death Donations may be sent to the treasurer of the Newbolt Fund, Mr Lyon H Maxwell, at the hospital

AT the invitation of the Hong Kong and China Branch of the British Medical Association a joint conference with the China Medical Missionary Association will be held at Hong Kong on January 21st, 1925, and following days Further particulars will be published shortly

THE annual dinner of past and present students of St Mary's Hospital Medical School will take place at the Connaught Rooms, Great Queen Street, W C , on Monday, October 6th, when Dr E M Callender, C B E , will take the chair at 7 30 p m The honorary secretary is Dr Hope Gosse

THE prizes to students at Charing Cross Hospital Medical School will be distributed on Wednesday, October 1st, at 3 30 p m , by Sir Humphry Rolleston, Bt , President of the Royal College of Physicians of London The annual dinner of past and present students will be held on the evening of the same day at Gatti's Restaurant, when the chair will be taken at 7 30 by Mr Charles Gibbs, senior surgeon to the hospital The charge will be 12s 6d , which can be paid at the door or sent in advance to the Dean, Dr W J Tenton

A NEW course of post graduate study will commence at the National Hospital for the Paralysed and Epileptic Queen Square, Bloomsbury, W C 1, on October 1st and continue till November 28th The course will consist of out patient clinics, clinical lectures and demonstrations, and lectures on the pathology of the nervous system A course of lectures on the anatomy and physiology of the nervous system and of clinical demonstrations on methods of examination will also be given if a sufficient number of applications is received Further particulars can be obtained from the dean of the medical school at the hospital

THE Westminster Hospital is giving a two weeks' intensive course from Monday, September 22nd, to Friday, October 3rd, daily, from 10 30 a m to 5 30 p m , including clinical demonstrations, lectures, pathology, orthopaedics, and operations The first lecture will be given by Mr Walter Spencer at 10 30 a m on Monday, September 22nd, on oral sepsis On Saturday, September 27th, at Camberwell House (Peckham Road), Dr F Norman will deal with mental diseases The fee for the course is £3 3s , or £2 2s for either week A three weeks' course in ophthalmology is in progress at the Royal Westminster Ophthalmic Hospital from September 8th to 27th, comprising clinical instruction each afternoon from 2 o clock, special demonstrations three times a week on methods of examination, a fundus class, and clinical demonstrations on common affections of the eye From September 15th to 27th a course in infants' diseases has been arranged at the Infants Hospital, consisting of clinical demonstrations, "round table" consultations, and lectures, from 2 to 5 p m , the fee for the course will be £3 3s Dr Porter Phillips and Dr Thomas Beaton are giving a series of lecture demonstrations in psychological medicine at the Bethlem Royal Hospital from September 8th to October 25th, on Tuesdays and Saturdays at 11 a m , and will deal with the diagnosis and symptomatology of mental diseases, the psychoneuroses, and the medico legal aspect of insanity October courses will be held at the Paddington Green Children's Hospital in conjunction with the Victoria Hospital and Children's Clinic, Central London Throat, Nose, and Ear Hospital, Royal Free Hospital, London School of Hygiene and Tropical Medicine, and St Peter's Hospital Copies of the syllabus of each of the above courses can be obtained from the Secretary of the Fellowship of Medicine at No 1, Wimpole Street, W 1

THE following post graduate courses have been arranged for the near future in Paris a gynaecological course will be held at the Broca Hospital from September 22nd to October 4th, and will be mainly clinical and practical, a course in heart diseases, to include the study of cardiac syndromes of nervous origin, hypertension, and cardiac therapeutics generally, will be given at the Ambroise Paré Hospital from September 29th to October 11th, a practical course on the diseases of early infancy will be held at the Trousseau Hospital from October 6th to 18th

A PRACTICAL course on dermatology and venereal diseases is to be held by the Faculty of Medicine at Strasbourg from September 22nd to November 8th Lectures and demonstrations will be given at the Civil Hospital and the various special clinics concerned, and those attending the course will receive individual instruction in therapeutic methods, including radiotherapy and surgical procedures After each lecture a summary of two or three pages will be furnished to each member of the class The fee for the course is 200 francs, and application should be made to Professor Pautrier at the Faculty of Medicine Help will be given with regard to finding lodgings in Strasbourg during the course

WE have received a copy of the list of old students of St Thomas's Hospital corrected to last June The previous edition was issued in 1922 The book is full of information of interest to old students of the hospital On the title page are the telephone numbers of the various departments of the

hospital There is a complete list of the days and times of attendance of the medical and surgical staffs The names of old students are arranged in two lists—the one alphabetical and the other according to locality In the alphabetical list there are given the date of entry, the qualifications and distinctions and the address of each individual, together with a summary of his scholarships, posts held while at the hospital, and present appointments The local list is followed by lists of medical officers of the naval, military, and Indian services of past and present officers of the hospital and medical school, and of scholars and medallists There is also a record of old students who have died since the last publication of the book The editor, Mr Robert Hopkins, is to be congratulated on having produced the best old students list that we have seen

THE next half yearly election for the admission of fatherless children to the Royal Infant Orphanage, Wanstead, E 11 will be held in November Children under 7 years of age are eligible, and applications for information and nomination papers should be addressed to the Secretary at the Orphanage at once

THE freedom of the city of Warsaw, where she was born and received her early education, has been conferred on Madame Curie

THE King has granted Dr Charles Todd, O B E, technical expert to the Egyptian Department of Public Health, permission to wear the insignia of the Second Class of the Order of the Nile conferred upon him by the King of Egypt in recognition of valuable services rendered

THE international congress on industrial hygiene, held at Geneva in July, attracted some thirty doctors and others interested from Europe, America and Japan Professor Leonard Hill's paper on ventilation and the value of the kata thermometer was read by Dr Wyatt owing to the indisposition of the author Other questions considered were fatigue tests, the application of methods of illumination in workshops and miners nystagmus

THE annual general meeting and conference of the Institute of Industrial Welfare Workers will be held at The Hayes Swanwick, Derbyshire, from September 26th to 29th The subject of the conference will be The doctor and the psychologist in industry On September 27th Dr C S Myers, Director of the Institute of Industrial Psychology, will speak on the subject of 'What psychology can do for industry,' and will be followed by Dr W F Dearden honorary secretary of the Association of Certifying Factory Surgeons, who will deal with the subject of 'What medical science can do for industry' In the evening of the same day "The psychological and physiological aspects of accident prevention will be discussed by Dr Millais Culpin and Dr H M Vernon, Investigator for the Industrial Fatigue Research Board Further information may be obtained from the conference secretary Miss N J Kessler, West Lynn, Altrincham, Cheshire

THE annual general meeting of the Medical Sickness Annuity and Life Assurance Society Ltd will be held at the offices of the company Lincoln House, 300, High Holborn, W C 1 on Monday, October 6 h at 4 p m

ST LUKE'S INTERNATIONAL HOSPITAL in Tokyo has received 150,000 yen (over £13 000) from the Japanese Home Department to provide additional equipment This money comes from the fund raised by the Japanese Red Cross Society after the earthquake in September last year and is given in view of the work carried on by the hospital among the necessitous, and also in consideration of the fact that the hospital buildings were destroyed at that time

THE annual exhibition of the Royal Photographic Society of Great Britain will be opened at 35, Russell Square W C 1, to-day (Saturday, September 13th) at 3 p m by the president, Mr J Dudley Johnston The memorial to Henry Fox Talbot will be unveiled by Dr G H Todman The exhibition will remain open until Saturday October 25th

In *Vital Statistics of Non Native Officials* published by the Crown Agents for the Colonies at 4, Millbank S W 1, price 6d, an account is given of the statistical returns for 1923 The invaliding rate shows a slight improvement on that of the previous year, though an increase in the death rate occurred

THE *Journal of Nervous and Mental Diseases* of New York proposes to celebrate its fiftieth anniversary this year by the publication of an index to its fifty volumes

THE fourth congress of the French Association of Pediatrics will be held in Paris from September 29th to October 1st inclusive, under the presidency of Professor Marfan The subjects to be discussed include the etiology and pathology of rickets the prophylaxis and treatment of congenital syphilis, and the treatment of purulent pleurisy in infancy

WE regret to learn of the death, on September 9 h, of Dr R J Farman, secretary of the London Panel Committee

In compliance with the resolution adopted by the House of Commons before the adjournment, the Minister of Health has appointed a committee under the chairmanship of Sir Ernest W Moir, M Inst C E, to inquire and report as to new material or methods of construction of houses for the working classes and to make recommendations as to the organization required for securing the adoption and use of approved new materials or methods by local authorities and other bodies or persons providing such houses The members of the committee include architects and engineers, persons interested in local administration, and representatives of master builders and operatives, as well as of the Ministry of Health and Office of Works

Dr J S Haldane, F R S of Oxford is the new president of the Institute of Mining Engineers, and will be in the chair at the annual meeting which is to begin at Wembley Exhibition on October 2nd He is director of the mining research laboratory in the University of Birmingham and his researches on the safeguarding of health in mines are well known

Dr Arthur Newsholme has been nominated by the Minister of Health to be a member of the Metropolitan Asylums Board

We regret to record the death, on September 6th, at the age of 88, of Sir Frederick Needham, who had been associated with lunacy administration all his life and was appointed a member of the Board of Control in 1892 We intend to give some account of his career in our next issue

The Council of the Royal Sanitary Institute has accepted the invitation of the city of Edinburgh to hold a congress and exhibition there next year (July 20th to 25th)

Mr Joseph Briggs has given £1 000 to the Bradford Royal Infirmary to name a bed in memory of his wife and other deceased members of his family

The late Mr Frederick Fountain bequeathed to the Miller General Hospital for South East London a house known as Cedar Bank, to be used as a convalescent home, and £12 000 as an endowment for its upkeep Sir James and Lady Carmichael have given £10 000 towards the cost, estimated at £60 000 of erecting the Will am Shepherd Memorial Wing at the Bolingbroke Hospital Wandsworth Common Under the will of the late Mr Walter John Tillett shipowner of Penarth, the Cardiff Royal Infirmary receives £10,000 the income from which is to be devoted first to the maintenance of the Elizabeth Tillett bed in memory of his wife, and subject thereto for the general purposes and upkeep of the infirmary

Letters, Notes, and Answers.

The telephone number of the BRITISH MEDICAL ASSOCIATION and BRITISH MEDICAL JOURNAL is Gerrard 2630 (Internal Exchange) The telegraphic address are

EDITOR of the BRITISH MEDICAL JOURNAL *Attiology Westrand London*

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements etc) *Articulate Westrand London*

MEDICAL SECRETARY *Mysteria Westrand London*

The address of the Irish Office of the British Medical Association is 16 South Frederick Str Dublin (telegram *Bacillus Dublin* telephone 4737 Dublin) and of the Scottish Office 6 Parland Square Edinburgh (telegrams *Association Edinburgh* telephone 436 Central)

QUERIES AND ANSWERS.

AURIS asks for advice in the selection of a battery for zinc ionization in ear cases He has not found dry cells satisfactory and has plenty of room at his command.

MUSHROOM POISONING

DR. W B WADSWORTH (Taunton) writes This morning a patient of mine gathered a large basket of mushrooms which his family divided with the next-door neighbour In one case the stalks were removed before cooking, and no ill effects followed the meal in the other household the stalks were cut through and part of them were eaten these people (three) suffered from acute vomiting and diarrhoea but all the symptoms passed off in a few hours What is the explanation? Does the stalk of the mushroom contain a poison which is not present in the mushroom itself? I have looked up *Mrs Leeton* and her instructions with regard to the preparation of mushrooms is to peel the top and cut off a *portion* of the stalk" A possible explanation might be found in the cooking

THREADWORMS

DR WILLIAM COBBETT (Worthing) writes in response to J E W's request (August 30 h p 391) for suggestions in the treatment of a stubborn case of threadworms Has he by chance tried the effect of garlic which has given me excellent results? I should suggest the nightly injection into the empty bowel through a

soft catheter of xviii–xii of a solution of garlic juice (conveniently prepared with suc allii sativi, Allen and Hanburys) combined with the internal administration of garlic oil capsules m2 If these can be obtained keratin coated so much the better The frequency of the enemata can be reduced as the condition improves, and the usual precautions against auto reinfection are to be strictly observed

DR G A FERRABY (Nottingham) writes Some years ago I successfully treated a case by the simultaneous use of salt enemata and the oral administration of santonin The usual routine of a normal saline enema in the evening followed in half an hour by a smaller enema of strong salt solution was adopted I thought it probable that threadworms in the upper part of the colon were killed by the santonin and in the lower part by the salt

DR G S ARMITAGE BISHOP (Melton Mowbray) writes I had a similar case in a girl aged 12 years After trying all the usual remedies, including massive doses of bismuth, I removed the appendix, which I found full of minute threadworms Bismuth then cleared the condition in a few days, and she has now been free from threadworms for twelve months

DR GEORGE P BLETCHLY (Nailsworth, Gloucestershire) writes that "J E W's" case is similar to one reported in the BRITISH MEDICAL JOURNAL of April 19th, 1924 (p 735) The worms evidently breed in the appendix, and the only cure is to remove that organ

*** We are reminded that Dr Claude Wilson published a paper in this JOURNAL in 1912 (vol i, p 829), pointing out that the appendix is by no means an uncommon nursery for thread worms, and that obstinate cases which resist repeated courses of treatment may often, and perhaps generally, be thus explained He referred to a paper by Mr Burgess published in the same volume (p 415) on five hundred consecutive operations for acute appendicitis, in which it was stated that threadworms were present in several cases Dr G Macdonald of Scarborough, in the same volume (p 485), reported a case in which, in an appendix removed from a woman, aged 34, two distinct collections of threadworms were found towards the base Dr Wilson also quoted from Dr G F Still's book, *Common Disorders and Diseases of Children*, in which the subject was discussed at some length In one hundred necropsies in children between the ages of 2 and 12 years Dr Still found threadworms in 32 per cent, and in two thirds of these they *were in the appendix He added that in some cases the* appendix was the only part in which the threadworms were found Dr Still's conclusion was that the appendix was a common breeding ground for threadworms, and that this made intelligible the extreme obstinacy of some cases to all treatment

HARD WATER AND CALCULI

"C" asks Does "hard water"—that is, lime, etc—tend to produce stone in the kidney or bladder? Is hard water injurious to one who has on several occasions passed a renal calculus?

*** Opinion on these questions is divided Surgeons for the most part speak of "hard water" as an etiological agent in *calculus formation* Physicians are cautious in the expression of their opinions, and shelter themselves with "may" or "it is said" Pathological textbooks do not consider it likely that hard waters favour the formation of renal or vesical calculi Hygiene experts are almost unanimous in boldly declaring that "hard waters" do not predispose to such deposits This diversity of opinion is partly due to the fact that discrimination has not always been made between the two questions asked We would answer the first in the negative, and the second (but with less confidence) *in the affirmative It must be remembered* that stones in the kidney are usually composed of urates, uric acid, oxalates, or a combination of these with phosphates Vesical calculi are commonly phosphatic The hardness of water is due chiefly to carbonates, and to a lesser extent to sulphates and phosphates A calculus consists of a nucleus of mucus, cell debris, or foreign matter in and upon which the urinary salts become deposited, often in concentric layers The formation of a calculus is due to some defect or disease in the organs of excretion, and there seems little reason why we should blame other systems But once the calculus has formed it is possible that the drinking of water rich in calcium salts may be instrumental in furnishing bases for inorganic calculi

INCOME TAX

Sale of Practice and Purchase of Another

"L B C" sold a practice at A and purchased one at B In accounting for his liability in respect of the latter practice h included as cash receipts moneys received but handed over to his predecessor, the inspector of taxes at A ho vever, requires him to pay tax on moneys handed on by his succe sor there, or, as an alternative, to put the assessments there on to the basis of bookings

* There is obviously a difference of practice between the two inspectors, which if carried through would hit our corre spondent unfairly The practice at B has, in our opinion, been dealt with correctly, and we consider the attitude of the inspector at A to be without justification "L B C" might inquire whether *his successor at A* is not adopting the cash receipt basis, whether he is in fact or not it is presumably open to him to do so, provided that he includes *all* the receipts in his computation, and it must surely be obvious that "L B C" cannot be made to include in his returns payments which can correctly be included in the returns of another person The arrangement made at B is tolerably simple and quite common, and the request that "L B C" shall pay on past receipts at A can be correct only if the past assessments have been insufficient The inspector practically admits this in putting the alternative of putting the assessments from 1920–21 onwards on to the gross bookings basis But this would be unfair The earliest of the years providing the 1920–21 average would be 1917, when, owing to the war, the level of book debts was no doubt low "L B C" adhered loyally to the cash basis arrangement when it was against him, and it would be altogether unreasonable to alter it now—and on what ground? That he has sold the practice, which is a fact quite irrelevant to the main question If the arrange ment can be set aside in such a case as this, there seems to be no reason why any inspector at any time should not decide to effect a change and revise four or five years' assessments at once We suggest that "L B C" might put his views to the inspector at A once more, if he does not receive reasonable satisfaction he might point out to the Secretary, Board of Inland Revenue, Somerset House, W C 2, the effect of the difference in practice between the officials for the two districts and ask the central authority to say which view is considered to be correct

Adjustment of Assessment

"A P A" seeks advice in somewhat unusual circumstances Some time ago he purchased a practice from his father for a certain sum, the debt to be liquidated by payment to the father of the annual profits less £600 retained, *until the capital sum* was extinguished "For convenience" the father continued to return the practice profits for assessment to income tax on the basis that he was the proprietor, and that he paid a salary of £600 per annum to the son It may be assumed that by April 5th, 1925, the debt will have been paid off, the son has been refund ing to the father tax at the standard rate on the annual alloca tions to the debt, seeing that these sums represent capital so far as the latter is concerned *How long should this continue?*

*** The arrangement made between the two parties is, of course, entirely innocent, but is equally wrong, and may possibly have affected the total amount of tax paid (one way or the other) in connexion with allowances, such as for earned income and life assurance There is a fallacy involved in speaking of paying tax in 1925 on the 1924 receipts, tax paid on the return for the financial year ending April 5th, 1926, is the tax on the earnings *of that year*, though the amount paid is calculated on the artificial three years' average It seems to us that a simpler adjustment would have been for the son to pay all the income tax liability from the date he took over the practice, *plus* the relief afforded to the father on the assessment If it is desired *not to make any radical* change the son might take over *all* tax in respect of the year commencing April 5th, 1925, and onwards, but the only way of obtaining a really correct adjust ment would appear to be to approach the local inspector of taxes explain the circumstances, and obtain a recalculation of the respective liabilities of father and son

---

LETTERS, NOTES, ETC

THE DURATION OF PREGNANCY

DR D A MCCURDY (Londonderry) writes Medical men concerned in the medico legal aspect of the duration of *pregnancy* may be interested in the following figures a woman confined on August 13th, 1921, assured me—and I believed her statement—that up to the time she became pregnant after her previous *confine* ment she had had but one connexion with her husband, which occurred on November 22nd, 1920 The period of gestation would therefore be 265 days, or 38 weeks less 1 day

A WARNING

DR ARTHUR LEE of Bournemouth writes to say that he was *induced* to lend some money to a person who seems to be the same individual as mentioned by Dr W G Niall (Chatham) in our issue of August 23rd (p 348) The money was not repaid by the date promised

VACANCIES

NOTIFICATIONS of offices vacant in universities, medical colleges, and of vacant resident and other appointments at hospitals, will be found at pages 32, 33 35 and 37 of our advertisement columns, and advertisements as to partnerships, assistantships, and locumtenencies at pages 34 and 35

A short summary of vacant posts notified in the advertisement columns appears in the *Supplement* at page 115

EPITOME OF CURRENT MEDICAL LITERATURE.

Medicine

176 Blackwater Fever

O E JACKSON (*South African Med Record*, June 23th, 1924, p 273) considers that blackwater fever should be classified among the malarias, and not as a separate disease Examination of the theories as to its cause points to malaria as supplying the specific organism, and though quinine may precipitate an attack it is not the primary cause Acidosis may be created by a malarial attack, and the same condition may be produced by irregular quinine taking The presence of the malaria parasite, the response to quinine the seasonal prevalence, the geographical distribution, the resulting debility, and the necropsy findings in both diseases point very clearly to malaria being the root cause of blackwater fever Repeated attacks of malaria with a resulting acidosis, which is still further increased by irregular dosing with quinine, in a patient who leads a life of habitual acidaemia afford adequate explanation of the occurrence of haemoglobinuria in an otherwise ordinary malarial attack The prophylaxis of blackwater fever is the prophylaxis of malaria, and with ordinary antimalarial precautions, the regular administration of 5 grains of quinine daily, regulation of the bowels, and care in diet and exercise for the avoidance of acidosis the disease can be prevented and a person who has once suffered need not necessarily be liable to a second attack, even if exposed to predisposing factors During an attack quinine should be given intramuscularly free action of the bowels kidneys, liver and skin obtained, and the acidosis corrected by the administration of sodium bicarbonate During convalescence the patient should take quinine in gradually increasing doses up to 15 grains per diem, but in the event of haemoglobinuria appearing the quinine must be withheld for a day or two, and eliminative treatment adopted it being realized that quinine tends to produce acidosis if the eliminative functions are impeded Further research is needed regarding the use of transfusion, the value of kidney decapsulation for anuria and the production of an auto haemolyser it is suggested that some use might be made of abrin, an antidote for haemolysis caused by poisonous fish

177 A Simple Clinical Test in Sciatica.

E WARBURG (*Ugeskrift for Laeger*, June 12th, 1924, p 465) describes a phenomenon which he has invariably observed in twenty five cases of sciatica investigated during the past year The affected limb is flexed at the thigh while extension is maintained at the knee, the flexion being increased until pain is provoked in the hip or back of the leg This pain ceases when the amount of flexion is reduced a little Pain can again be excited with the limb in this position if pressure is now exerted on the tendon of the biceps in the popliteal region The author argues that this observation is confirmatory of Helweg's teaching that sciatica is not a true neuritis but a myopathy, the result of over exertion of the muscles concerned The objection might be raised that the pain provoked by pressing on the tendon of the biceps muscle was due to pressure exerted on the peroneal nerve, which runs close to the tendon of the biceps But the author has succeeded in isolating the one from the other and in showing that the tendon and muscle, but not the nerve, must be held responsible for the pain provoked Were the pain due to pressure on the peroneal nerve, pressure under the same conditions over the tibial nerve in the middle of the popliteal space should also provoke it, but it does not do so as a rule

178. The Heart in Secondary Syphilis

ODA I SAGGIOPO (*Cuore e circolazione*, April, 1924, p 137) records her observations on the heart in twenty cases of secondary syphilis The patients were almost all young men in whom lesions of the circulatory system due to advanced age and alcoholism could be excluded Pulse tracings in all cases were taken in the supine position Her conclusions are as follows (1) The syphilitic virus acts on the heart in the secondary stage of infection by producing circumscribed areas of myocarditis which are sometimes latent and then can only be discovered by careful examination (2) Patients in this stage of infection may suffer from subjective disturbances of the circulatory system such as extra-systoles which are often felt by the patients themselves, tachycardia, dyspnoea of effort and tachycardia of effort (3) Examination of the cardiac function reveals a myocardium with feeble powers of resistance and often signs of true myocarditis such as increase of the transverse diameter, irregular and small pulse, and dull or impure heart sounds (4) Disturbances of innervation of the circulatory system are frequent, being due to lesions of the myocardium at the point of entrance of the terminal branches of the vagus (5) Extra systoles, tachycardia, palpitation, and a state of vagotonia characterized by exaggeration of the oculocardiac reflex, sometimes accompanied by vomiting and syncope are the manifestations of this disturbance of innervation (6) Examination of the cardiac function is best carried out by careful physical examination, Katzenstein's test (increase of blood pressure on constriction of the femoral artery indicating myocardial efficiency), and ocular compression

179 Rheumatic Polyarthritis following Injury

H ZAGELOW (*Deut med Woch*, June 20th, 1924, p 816) gives an account of seven cases of traumatic rheumatic polyarthritis He notes that the trauma need not be severe in itself, a slight, but continuous, trauma being often the determining factor in the genesis and localization of the disease Such slight but constant injuries are those which deformities of the foot —for example pes planus ex varus—entail In such cases the disease spreads from one joint to another upwards, the course and prognosis of the case differing in no essentials from non traumatic polyarthritis In both the traumatic and the non traumatic forms there is the characteristically erratic involvement of various joints, the endocardium is involved in a certain proportion of cases, and there is the same transition from the acute to the chronic stage The distinction between traumatic and non traumatic cases depends largely on the demonstration of a short interval between the injury and the onset of symptoms in a joint which should be close to, or at the site of, the trauma The author takes for granted that germs play a decisive part in the development of traumatic rheumatic polyarthritis, but he does not venture an opinion on the exact process of infection, merely stating that cocci may already have been circulating in the blood at the time of the trauma, or may have subsequently entered the body and found a *locus minoris resistentiae* created by the trauma

180. Treatment of General Paralysis

A STARCKE (*Nederl Tydschr v Geneesk* April 19th, 1924, p 1751) describes the following method of treatment, which he considers to be as effective as inoculation of malaria and much less dangerous An injection of ordinary boiled milk is given in the morning The milk must not be shaken or else clots will get into the syringe The first dose is 40 c cm The injection is usually followed by a rise of temperature in the evening to between 101 2° and 104° I After the injection the patient should walk about or be massaged for a few minutes to promote absorption of the milk In the evening when the temperature is raised, an intravenous injection of neosalvarsan is given, the dose ranging from 600 to 900 mg with the result that the temperature rises still higher If it reaches 105 8° cold packs should be applied until it falls below 104° This procedure is repeated every week the dose of milk being increased so that the temperature rises at least to 102 2° When the evening temperature has reached the level of 103 6°, a dose of 50 c cm should prove sufficient Large doses of potassium iodide were also given throughout the course of treatment No symptoms of anaphylaxis were observed Improvement may be seen at the end of a month but if it does not occur by then the treatment is continued, a watch being kept upon the urine

181 Granuloma Inguinale.

S B SCHOCHLT (*Surg, Gynecol and Obstet*, June, 1924, p 753) states that granuloma inguinale (chronic infectious granuloma) is not very uncommon although often unrecognized in temperate climates More than sixty cases were reported during the past three years in the United States The etiological part played by the intracellular bodies described by Donovan is uncertain but they should be sought in all chronic ulcerations about the genitals especially when syphilis and tubercle have been excluded as causative factors Diagnosis from epithelioma is made microscopically from lupus vulgaris by the confinement of granuloma inguinale to the pudendal region, by its affecting mucous as well as cutaneous surfaces, and by the absence of giant cells and caseation from syphilis and yaws by the negative Wassermann reaction and the absence of general adenopathy Treatment by intravenous injections of antimony derivatives is successful, but not altogether devoid of danger of antimony poisoning

Surgery.

182 Pulmonary Complications in Gastric Surgery.

R GRÉGOIRE (*Bull et Mem Soc Nat de Chir*, July 12th, 1924, p 830) reminds us that for many years there has been discussion of the best method of the pulmonary conditions which fre[illegible] perations on the alimentary canal Certain conditions seem to increase their incidence, whilst certain subjects to them The author finds that patie[illegible] malignant disease are more liable to their onset, being less resistant in some way The use of general inhalation anaesthesia, either by the cooling of the alveolar air or by its effect on the vagus nerve, encourages pulmonary complications Then there is the lack of movement and active exercise after an operation on the abdomen, whilst the action of the lungs is reduced to a minimum, all these favour local congestion and inflammation The bacteria found in the air passages have been shown to be identical with those found inside the stomach It appears possible, then, that during an operation these organisms may enter the divided vessels and lymphatics and pass to the lungs, where *they form septic emboli* The author considers that if one can diminish the virulence of these organisms, and avoid general anaesthesia and the prone *position* in bed, it is possible to lessen the risk of pulmonary complications He therefore practises gastric lavage, prior to operation, with a watery solution of iodine He uses regional or local anaesthesia, and gets the patients up early after operation By adopting these measures he has reduced the incidence of pulmonary complications *from 21 per cent* to almost *nil*

183 Comparison of Cholecystostomy and Cholecystectomy

J P DEAVER and S P REIMANN (*Journ Amer Med Assoc*, June 28th, 1924, p 2115) describe the relative value of the operations of cholecystostomy and cholecystectomy, and conclude that *the latter is definitely preferable* They maintain that it is as safe as the former operation, the patient does not miss an organ which has for some time been functionless or, at any rate, impaired, and the chances of complete recovery or cure are greater, recurrences being less common and usually less serious than after cholecystostomy Moreover, the vicious circle due to an inflamed gall bladder infecting neighbouring organs and being itself reinfected from *them is abolished by the operation of cholecystectomy* They point out that two questions remain to be answered (1) The gall bladder adds mucus to the bile, does it add anything else? (2) The gall bladder also concentrates the bile by removing what amounts to normal saline solution *from it*, does it remove any other substances of importance? These questions are not very significant, however, since a normal gall bladder is not removed and a diseased gall bladder has ceased to function normally—in extreme cases, at any rate The border line cases between the normal and slight disease require, however, to be considered, but it is doubtful whether any bad results follow the removal of the normal organ Dilatation of the ducts, incontinence of bile, and other sequelæ have *followed removal*, but the authors consider it extremely doubtful whether the general metabolism of the [illegible] as does always occ[illegible] by We would answer the first in the [illegible] body has been affected [illegible]ve It

184 Gastric Myoma

[illegible]se 1924, p 1341), who N KLEIBER (*Zentralbl f Chir*, June 21st, 19[illegible] a tumour was records a case in a woman, aged 62, in whom the [illegible] myoma, successfully removed by Bier, states that gastric tumours which was first described in 1762, is one of the rarest [illegible] mucous of the stomach Virchow distinguished internal or sub[illegible] the myoma from external or subserous myoma, according as the *tumour* projected into the cavity of the stomach or protruded from the wall into the peritoneal cavity Steiner collected 21 cases which had been published up to 1898, and Hake in 1912 collected 36 more, including 3 of his own, to which Kleiber adds another 7, 4 of which were of the external variety and 3 of the internal Females are more frequently affected than males, especially between the ages of 30 and 55 The form and size of gastric myomata vary considerably They may be as small as a millet seed or as large as a man's head They may be smooth, round, or elongated, or nodular in parts, solitary or multiple Their consistence is usually hard An internal myoma only rarely exceeds a hen's egg in size, but is usually much smaller, while an external myoma may be the size of a child's head or larger The most frequent site for the development of the tumour is the greater curvature, from which it *develops* as a sessile or pedunculated growth Its clinical appearance varies according to its situation, size, and form The internal myoma may cause haemorrhage, as in Kleiber's case, or signs of pyloric stenosis when it is situated in the region of the pylorus On the other hand, it may grow to an enormous size without causing any special symptoms Usually, however, the patient complains of dragging pains in the gastric region, nausea and vomiting While myoma is usually a benign tumour, cases have been recorded of its undergoing sarcomatous degeneration In some instances a pure myoma may give rise to metastases, as in a case recorded by Hansemann, in which similar tumours to the gastric growth were found in the pancreas and in the retroperitoneal tissue in the appendix area In none of the recorded cases has the diagnosis of gastric myoma been made before operation

185 Acute Cholecystitis in Children

GRAFF (*Zentralbl f Chir*, June 7th, 1924, p 1239), who records an illustrative case, states that only 25 cases of acute non calculous cholecystitis have been recorded in children 18 occurred in typhoid fever, 1 in *B coli* infection, 1 in paratyphoid fever, 1 after suppurative appendicitis and septicæmia, and 1 after influenza, while in the rest no bacteriological examination was made Ten cases following typhoid fever, which were not operated on, were all fatal, while of eight on whom operation was performed all but one recovered Graff's patient was a boy, aged 5 years, who developed loss of appetite and slight gastro-intestinal disturbance after eating a banana On the third day he complained of abdominal pain, which was *localized in the region of the umbilicus* On the eighth day there was tenderness in the region of the gall bladder, with muscular resistance and dullness on percussion The temperature was 100·4° and the pulse 110 On laparotomy a tense oedematous gall bladder was found containing *thick blackish fluid* The *organ was removed* and subsequent recovery was uneventful The mucous membrane of the gall bladder was much swollen and gangrenous in parts. Unfortunately no bacteriological examination was made

186 Acute Haemorrhage due to Gastric Ulcer

F ERKES (*Zentralbl f Chir*, July 12th, 1924, p 1496) refers to Konigsberger's and Rammstedt's recent papers (*Ibid*, pp 494 and 1048), in which *they recommend* closure of the ulcer by sutures Erkes formerly used Kraft's method, but latterly he has adopted that of Seidel in the treatment of both acute and chronic ulcers of the stomach or duodenum. In all cases of gastro-enterostomy he sutures and inverts the ulcer in order to prevent post operative haemorrhage, where resection is found to be impracticable In 3 cases of chronic ulcers with recurrent bleeding and in 2 cases of acute haemorrhage complete cure followed the operation All five cases have been free from haemorrhage for a period of one to three years In 19 other cases of operation for gastric or duodenal ulcer with occult haemorrhage the operation was successful *in all but one*, in which the sutures gave way In this case there was severe cicatricial pyloric stenosis, but the ulcer appeared to be healed Four days after the operation severe haemorrhage occurred In 3 of these 19 cases a second laparotomy for other conditions *became necessary* a year after the original operation, in every case the site of the raw ulcer was marked by a soft linear greyish white scar Erkes emphasizes the importance of inversion and approximation of the healthy tissues in order to prevent risk of perforation

187 Surgical Tuberculosis in Childhood

S JOHANSSON (*Svenska Lakaresallskapets Handlingar*, June 30th, 1924, p 35) publishes an account of an investigation, conducted under the auspices of the Swedish National Association for Combating Tuberculosis, of the fate of the 407 patients treated for surgical tuberculosis in childhood in the period 1909–23 in Gothenburg It was found that 94 of these children had died, 40 per cent of the deaths being due to tuberculous meningitis and 22 per cent to pulmonary tuberculosis The author does not believe in a wholesale discard ing of *operative treatment* in favour of more conservative measures, and he notes that in 26 out of 24 cases in which para articular foci threatened a joint *the timely operative* removal of these foci was followed by recovery, the mobility of the joints being restored to normal or almost to normal The ratio of cases given conservative treatment to those given [illegible]ative treatment was 242 to 165 Conservative *treatment* op[illegible] was given to 65 cases of Pott's disease, 28 cases of alon[illegible] were operated on according to Albee's method Only whic[illegible] the 80 cases of tuberculous hip disease was operative in 4 of[illegible]t undertaken Conservative *treatment* alone was treatm[illegible] 45 out of 64 cases of tuberculosis of the knee, in the given [illegible] 19 cases an operation was performed Most of the remain[illegible] tuberculosis *of the ankle*, and all the cases of tuber cases [illegible] the ribs, were operated on whereas the treatment culosis [illegible]tten operative as conservative in *the case of* tuber was as[illegible] the elbow The chief lesson of the author's paper culosis [illegible]nservative and operative treatment are *adjuncts* is that [illegible]he other, and not rivals the one o[illegible]h

Radiology and Electrology.

183 Radiography of the Mastoid in Cases of Radical Operation

G FERRERI (*Arch Internat de Laryngol, Otol et Rhinol*, June 1924 p 650) relates a case of a young man who was operated upon in a small provincial town for a long standing otitis media with polypi in the meatus The operation was supposed to have been a complete radical one, but later examination showed that the meatus was much stenosed still contained polypi and pus, and there was a discharging sinus at the lower extremity of the retroauricular scar The patient suffered from pain and headache, and a second exploration was performed It was found that there had been merely an incision of the soft tissues and that the bone had not been interfered with A complete radical mastoid operation was then performed, with an excellent result The author deplores the fact that such procedures are possible and has devised a method for estimating the amount of bone removed by operations behind the ear He found that an *x* ray photograph of the mastoid region was always obscured by the shadows of other parts of the skull, and it was not possible to delimit the extent of the mastoid cavity The idea of instilling a semi solid opaque substance into the meatus was abandoned owing to the difficulty of removing all the substance afterwards The author's method is to soak a length of narrow ribbon gauze in a mixture of barium sulphate, gum arabic and water which has been boiled The gauze previously sterilized is dried slowly and is then ready for use The ear and its cavity are carefully cleaned and the meatus and the mastoid cavity very carefully packed with the gauze Radiograms are then taken in an antero-posterior and in a lateral direction The first radiograph shows the depth of the cavity, the second shows the extent, especially backwards and the size can be accurately gauged from the two views This method is very useful in determining the extent of a prior operation, and distinguishes those cases in which only a Wilde's incision has been performed

189 X ray Treatment of Enlarged Prostate.

C GUILBERT (*Paris med* April 12th, 1924 p 343) states that though there is no other condition in which radiotherapy is more definitely indicated than in prostatic hypertrophy, this treatment has never been so popular as in the case of fibroids or malignant growths The rationale of *x*-ray treatment of enlarged prostate is that the condition is an adenoma frequently associated with more or less marked hyperplasia of the connective tissue Now, according to the law of Bergonie Tribondeau, adenoma both in theory and practice, is very sensitive to *x* rays so that even in adenofibroma the adenomatous tissue is always affected provided sufficient doses of *x* rays are given Failures in the past have been due to inadequate dosage and to the intervals between applications being too long Guilbert condemns the perineal route as being dangerous because the skin of the perineum is much more sensitive than that of other parts, and inadequate because in view of the risk of severe skin reactions sufficiently large doses cannot be employed in all cases He therefore makes use of the method of six windows arranged round the body, systematically avoiding the perineum, with large doses amounting to 95 to 100 per cent of the erythema dose in preference to fractional and repeated doses This method is well supported by old persons and avoids all risk of *x* ray dermatitis Close collaboration between the radiologist and surgeon is required

190 Calcified Hepatic Cyst simulating Biliary Calculi

MASSELOT, BOLQUET and JALBERT DE BEAUJEU (*Journ de Radiol et d Electrol*, May, 1924 p 212) describe a case of erroneous *x* ray diagnosis A man was admitted to the French Hospital at Tunis complaining of pains in the right loin and hepatic region, which were not definitely radiating in character nor was there increased tenderness on palpation The urine was normal, the right kidney was not palpable, and there was no fever jaundice, or splenomegaly, but the patient stated that he had lost a little weight A skiagram of the subhepatic region showed a group of small irregular shadows in front of and below the shadow of the twelfth rib In profile these shadows were anterior to the vertebral column in front of the second lumbar vertebra Several skiagrams were taken at intervals after repeated purgation the appearances were unchanged The skiagrams suggested either (1) a conglomeration of small biliary calculi or (2) a large non homogeneous stone At the operation the gall bladder was found to be quite healthy but on the upper surface of the right lobe of the liver, near its margin at the level of the gall bladder, there was a clear yellow hard mass This was excised and haemorrhage was easily arrested A calcified cavity was found containing a chalky paste in which were very hard masses, no hooklets were found This appeared to be undoubtedly the terminal stage of some parasitic lesion (hydatid or otherwise) The authors refer to the work of Duval, Gatellier and H Beclere, who have described the various sources of error in skiagraphy of this region—for example, renal calculi, calcification of costal cartilages or of mesenteric glands, etc —but calcified hydatid cyst has not been recorded previously, usually it is too large to be mistaken

191 X ray Examination in Genito urinary Disease.

H D PODLASKY (*Urol and Cutan Rev*, June 1924 p 331) states that in incomplete urinary findings in tuberculosis of the genito urinary tract where cystoscopic examinations are in the early stages admittedly indefinite *x* ray examination of the chest will at times reveal acute or chronic tuberculosis long before the condition is shown by microscopical examination of the urine or animal inoculation The *x* ray findings may in some cases be difficult to interpret, but the case with which malignancy can be detected depends upon the form of the metastasis—that is, whether it is of the nodular or infiltrating type Although it is a well known fact that malignant disease of the prostate gives rise to metastases in the chest as well as in the lumbar vertebrae and innominate bones, examination of the chest is frequently neglected Podlasky therefore maintains that routine examination of the chest by *x* rays is as important in urology as the performance of a Wassermann test

Obstetrics and Gynaecology.

192. Acute Ulceration of the Vulva.

J E R MCDONAGH (*Brit Journ Derm and Syph*, July 1924 p 285) describes two clinical forms of acute ulceration of the vulva caused by (1) Doederlein's bacillus, and (2) Vincent's organism Both forms commence with severe constitutional disturbances, and give rise to very painful lesions In five cases due to Doederlein's bacillus the ulceration began with several small crater like ulcers on the inner surfaces of the labia from which the Gram positive bacillus was obtained The ulcers in this form are unaccompanied by discharge and lymphadenitis are not preceded by erosions, do not cause great destruction of tissue, and have no characteristic odour, these points distinguish them from that form of ulceration caused by Vincent's organism, the lesions from which are characterized by the appearance on the inner surfaces of the labia of multiple erosions which coalesce to form ulcers, with rapid destruction of tissue, accompanied by considerable discharge and characteristic smell, the inguinal glands being generally swollen and tender From the lesions a Gram positive fusiform bacillus associated with a Gram negative spirochaete can be obtained The latter (Vincent's) infection is the more severe of the two forms and may cause the greatest destruction of tissue Gram negative micro-organisms, as a rule, set up more severe infections than Gram positive In neither disease is the lesion auto-inoculable and similar lesions have not been produced in animals In one of the cases due to Doederlein's bacillus the lesions healed under treatment with ordinary antiseptic lotions and powder, but relapsed seven months later while in another every kind of local treatment failed until the ulcers were packed with intramine In the form due to Vincent's organism the lesions yield to treatment with hydrogen peroxide lotion locally combined with two arsenobenzene intravenous injections, but relapses may follow further injections pointing to the fact that the treatment acts by stimulating the patient's resistance and not by direct action upon the infecting organism

193 Treatment of Leucorrhœa.

P SALOMON (*Klin Woch*, July 15th 1924, p 1324) remarks that in treating patients complaining of vaginal discharge it is necessary to exclude gross disease of the vulva vagina, uterus, and adnexa constitutional disorders such as diabetes, and extragenital morbid conditions such as pulmonary tuberculosis If such causes are established they require appropriate treatment in their absence the object of treatment should be to restore normal biological conditions within the vagina Healthy vaginal secretion is slightly acid, owing to the presence of from 0 3 to 1 per cent of lactic acid, the acid is secreted chiefly by Doederlein's bacillus This acidity and the presence of this bacillus are necessary for the exclusion of extraneous pathological micro organisms In treating leucorrhœa it is therefore wrong to give antiseptic douches or tampons Daily instillation of lactic acid in 0 5 per cent solution suffices in many cases within three weeks to restore normal chemical and bacteriological conditions in the vaginal secretion The lactose preparation recommended by Loeser,

which contains living lactic acid bacilli in varying amounts, may be used Salomon has had good results from injections of a lactic acid producing colon bacillus, also by the simpler method of instilling in the vagina small amounts of milk which, after standing for some hours, contains the lactic acid bacillus, and often, in addition, organisms microscopically and culturally resembling Doederlein's bacillus

194 Sterilization after Caesarean Section

J B SWIFT (*Journ Amer Med Assoc*, July 19th, 1924, p 175) discusses the obligation of the obstetrician to advise how undue risks may be avoided after Caesarean section has once been necessary He se[illegible] fifty members of the American [illegible] and studied the records of the rep[illegible] which were performed at the Boston Lying in Hospital between the years 1916 and 1922 He correlates these findings and states his conclusions as follows The majority of gynaecologists believe that when a Caesarean section is performed for some reason which would entail grave peril to the life of the patient in a future pregnancy, such a patient should be sterilized at that Caesarean section No patient should be sterilized without the written consent of both herself and her husband, and no woman should be so treated at her first Caesarean section unless there are definite indications other than the possibility of a second Caesarean section As the successive sections increase in number general opinion is in favour of suggesting, and finally urging, sterilization, and Swift believes that the maximum number of sections permissible is four In answer to his inquiries as to the use of contraceptive measures in preference to sterilization, the majority of the replies were against contraception on the ground of its unreliability He considers that a repeated Caesarean section is less risky than the primary one, but insists that it is the duty of the performer of a Caesarean section to consider, not only the indications for the immediate operation, but also the possibility of future pregnancies and the steps to be taken with regard to them

195 Rectal Perforation in Ectopic Gestation.

A SCHWARTZ, P LUBIN, and A AMELINE (*Paris med*, June 21st, 1924, p 581) state that while numerous cases have been reported in which ancient remnants of ectopic pregnancy have been evacuated per rectum (often after suppuration) at the end of several years, acute perforation of the rectum by an early tubal gestation is relatively uncommon In the five cases which they have found recorded, and in a sixth case which they describe, the clinical picture was the same—amenorrhoea, abdominal pain, uterine haemorrhage, and painful defaecation, followed by sudden and profuse rectal haemorrhage Physical signs pointing to ectopic pregnancy have been clearly marked, and, in one instance, depression in the anterior wall of the rectum led to suspicion of the complication Operative approach should be made by the abdomen the rectum should be sutured in several layers, but a colostomy is not usually required

Pathology.

196 Sickle cell Anaemia

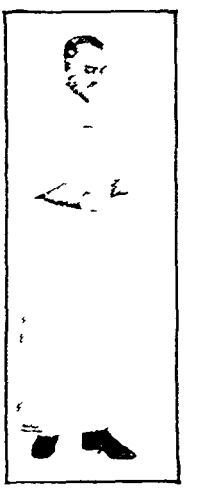
IN our columns of December 8th, 1923 (p 1109), we gave a description of sickle-cell anaemia based upon the *Bulletin of the Johns Hopkins Hospital* V P SYDENSTRICKER (*Journ Amer Med Assoc*, July 5th, 1924, p 12) has now collected a series of 80 cases, including ten family groups, and gives a detailed account of this anaemia, which appears to be a familial and hereditary disease, probably confined to negroes irrespective of sex It is present and recognizable at birth, and the author is inclined to attribute it to congenital defect of the spleen and blood forming organs, with a resulting change in the red blood cells which predisposes to haemolysis and phagocytosis Sydenstricker believes that the disease shows itself in two phases, in the latent phase there are few symptoms and physical signs, and blood examination alone establishes the diagnosis This phase is commoner than the active phase in the proportion of nine to one, and the two phases may occur in the same family, active disease being found in the children and grandchildren of patients with the latent phase The symptoms of latent disease are occasional muscle and joint pains, attacks of abdominal pain, sometimes associated with nausea and vomiting, and variable weakness and dyspnoea There may be some greenish yellow sclerotic discoloration, general glandular enlargement, and slight enlargement of the liver, splenic enlargement is rare In the active phase there is the very characteristic blood picture including reduction in the red cell count to the neighbourhood of two million, with proportionate reduction in haemoglobin and marked poikilocytosis in addition to the sickle cells, which occur in large numbers Many normoblasts occur, and many other red cells contain nuclear fragments Marked leukocytosis is present, but otherwise the white cells show few abnormalities, the differential count not being much altered The serum in these cases is a deep yellow and contains bilirubin Necropsies were performed on two cases with active disease, and on three with the latent type In active disease the spleen was very small, the pulp scanty, and Malpighian bodies barely visible, the trabeculae being large and numerous In many of these trabeculae and in the walls of some of the vessels there were collections of greenish plates and brown granules which gave the iron reaction, and there was much dirty brown non free pigment throughout the organ In the latent cases the spleen was characterized by an increased hardness, absence of visible lymphoid nodules, and a very dark red colour of the cut surface On microscopic examination intense engorgement with blood was seen, the Malpighian bodies were small and surrounded by areas of congestion The bone marrow in the acute cases was abundant, bright red, and perhaps thinner in consistency than normal There was marked diminution in the fat and an increase in the leucocytes and red cells, the reticular spaces and the capillaries being filled with sickle shaped and distorted red cells In the chronic phase the appearance of the bone marrow was similar but less striking The author points out the ability of pathological red cells to penetrate the reticular tissues of the bone marrow and the pulp of the spleen In the chronic cases there was no gross change in the liver, though the cell outlines were blurred, and there was a moderate degree of lymphocyte infiltration, together with diffuse iron free pigmentation In the acute cases the liver was very large, its cells were more granular than normal, and poorly defined There was a large amount of non free pigmentation

197 Achlorhydria in Pernicious Anaemia

M E SHAW (*Quart Journ of Med*, July, 1924, p 319) considers that it has been established that absence of free hydrochloric acid from the gastric juice is a constant feature of Addison's (pernicious) anaemia From examinations of the gastric juice in 7 cases of pernicious anaemia, and estimation of the amount of hydrochloric acid required to reach the acid point, the author has been able to measure the degree of achlorhydria In 5 cases of pernicious anaemia dilute hydrochloric acid was administered, made up into a palatable drink with lemon juice, sugar, and water, and the effect determined Theoretical considerations based upon the estimation of the degree of achlorhydria suggested that about 2 drachms of dilute hydrochloric acid (*B P*) would remedy the deficiency Experimental evidence showed that 1/2 to 2½ drachms restored the effective germicidal activity of the gastric juice in pernicious anaemia if given by the "continuous" method A F Hurst considers that the achlorhydria of pernicious anaemia is the primary defect, and that it permits the passage of organisms into the intestinal tract, where the toxins of the disease are formed and absorbed The object of treatment, according to this view, must be to restore the lost germicidal power of the gastric juice by remedying the lack of hydrochloric acid.

198 Mode of Action of Stomachics

A O HANNEBORG (*Norsk Mag f Laegevidenskaben*, June, 1924, p 369) has carried out investigations on healthy medical students given test meals in the morning on an empty stomach The various meals were removed with a stomach tube at short intervals, and the substances tested were plain water, tea, coffee, meat extract (bouillon), tincture aurata, tincture of gentian, and a decoction of condurango Cocoa and chocolate were also given, and were found to remain in the stomach for about three hours—that is, as long as an ordinary light meal—but coffee passed through the stomach in 75 to 100 minutes, and tea in 100 to 140 minutes Bouillon passed through the stomach more rapidly, taking only 70 to 90 minutes to do so Experiments with coffee from which the caffeine had been extracted suggested that it must be the caffeine on which the digestive action of coffee depends With regard to the stage at which the stomach passes on its contents through the pylorus, it would seem that this emptying process is independent of the secretion of hydrochloric acid, which was absent from the stomach of one of the author's test subjects, and yet an ordinary test meal passed through the pylorus as rapidly as in the other cases On the basis of this and other observations the author concludes that the main factor in the normal evacuation of the stomach is peristalsis, and his experiments with bitters such as gentian point to their action depending almost solely on their capacity to stimulate the stomach to contract more forcibly, and thus to expel, not only food, but also an accumulation of gas Probably the role played by the gastric secretions has been much overrated in the past, anatomical obstruction and motor disturbances of nervous origin are of more importance, since either of these may prevent expulsion of the contents of the stomach



Miller

SURGEONS' APRONS.

Full length pure gum rubber surgeons' protective aprons, with large bib, neckstraps, and waist band

No metal clips or fabric used in their make-up, save fabric insertion to strengthen the neck and waist-bands

After use, wash in warm water and disinfectant solution

WHEN a mother has to resort to foster feeding for her baby, with the choice of a suitable food comes the selection of an efficient Feeding Bottle

The invention of the new **COW AND GATE FEEDER** marks finality in Feeding Bottles

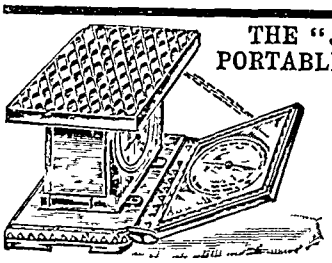
Many and varied have been the attempts to devise a bottle which allows a sufficient but not excessive supply of Food

Remembering how easy it has been previously for baby to get too much food or not enough, this has been a most difficult task, but at last we've got it, and, like most wonderful inventions, the idea is simplicity itself

An octagonal glass stopper, secured by a movable rustless clip at the opposite end to the teat, has a small zigzag groove which, when turned, makes the flow of food quicker or slower, to suit the sucking power of the infant

Cow & Gate
STOPPERED
Feeder

Obtainable from all Chemists **2/-** *Complete in Cartons*



Other features are clear markings for table spoons and ounces, a flat base, teat end out of contact with food when bottle is placed flat, entire absence of crevices, patent teat having tiny ribs inside—only needs to be tightly rolled between fingers to completely dislodge any secretion of food which may exist No child can remove either teat or stopper, leakage is impossible

It forms the IDEAL BOTTLE for the IDEAL FOOD

If any difficulty in obtaining write direct to—

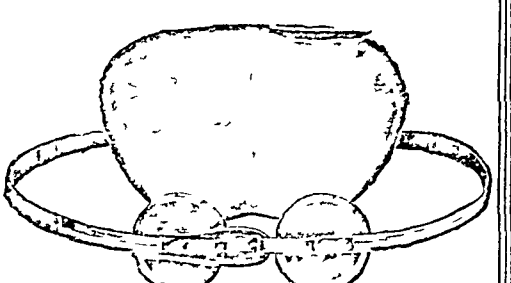
The "Curtis" Abdominal Support



in its relation to one's daily occupation.

Extract from "CHRONIC INTESTINAL STASIS" (A Radiological Study) by Dr. A. C. JORDAN:—

"Many occupations enforce long hours of fatiguing work in the upright posture with insufficient opportunity to lie down and rest. Those whose work necessitates lifting or carrying loads (*e.g.* labourers, warehousemen, etc.), are doubly liable to suffer from the evil consequences of dropping viscera. The "Curtis" Belt is a great help to these workers"—Page 179 (B)

MEDICAL EMPIRICISM

NO one who has breathed the pure air of Science can ever again be really satisfied with an empiric basis for his art Few practical men, however, would deny that at present most of our actual work must depend for its justification mainly on individual and collective experience

The theorists and the speculators from time to time drop into our laps gifts whose value is beyond price, but their real kingdom lies far ahead Many a new reputed remedy or scheme of treatment appears over the horizon, fills us with hope for a season, and then vanishes into the limbo of things that were

But a few old and tried remedies, less ambitious in their aims, live on For over fifty years ENO's "Fruit Salt" has held a unique place in popular therapeutics Its invariable effectiveness as an eliminator of noxious material from the alimentary canal, without drastic purgation, its agreeable taste, its purity and the uniformity of its physical and chemical composition, have earned for it a reputation, both lay and medical, that no mere advertising could have established

THE Proprietors of ENO's Fruit Salt will deem it a privilege to send any member of the Medical Profession for his personal use a bottle (Handy or Household size as desired) of their preparation with a copy of The Practitioner's Pocket Book This book is uniform with The Doctor's Pocket Remembrancer of which thousands of copies have been sent on request to medical men many of whom have expressed their high appreciation of its utility

THE PRACTITIONER'S POCKET BOOK

embodies in a concise form many practical axioms of interest and use to the practitioner numerous legal points of great importance to every doctor and the essentials of the chief procedures involved in general practice pathology

'PITIBULIN'

Trade BRAND Mark

Post Pituitary Extract

Specially prepared for Hypodermic and Intramuscular Injection

'Pitibulin' Preparations are physiologically tested and standardised by the most approved methods, and may be relied upon for purity, constancy, activity and asepsis

NOW ISSUED IN TWO STRENGTHS.

'Pitibulin' Obstetric

A 10 per cent. standardised extract of infundibular substance as recommended by the Medical Research Council for obstetrical and general purposes. Given intramuscularly Pitibulin Obstetric is invaluable for promoting uterine contraction in the second stage of labour and after delivery also for the prevention of post partum hæmorrhage.

Preparations

Azoule Pitibulin Obstetric—½ and 1 c.c. in each. In boxes of 6 and 12.

Azoule Pitibulin with Adrenin—½ c.c. with [illegible] In boxes of 6 and 12.

Azoule Pitibulin with Adrenin—1 c.c. with [illegible] In boxes of 6 and 12.

'Pitibulin' Surgical

A 20 per cent. extract of infundibular body This preparation is identical with 'Pitibulin as hitherto supplied by this House. Its use is especially indicated to raise blood pressure in surgical shock and post anæsthetic collapse In very urgent cases it may be administered per rectum or intravenously diluted with normal saline.

Preparations

'Azoule Pitibulin Surgical—½ and 1 c.c. in each. In boxes of 6 and 12.

Leaflet giving further particulars will be sent on request

ETHNOLOGICAL INDICATIONS FROM CHINESE ARCHÆOLOGY.—We know from statues, bas reliefs and wall-paintings what the men and women looked like who pioneered even the very early phases of the ancient civilisations of Egypt Mesopotamia and the Ægear We have so far, no similar representations of the early Chinese pioneers their most ancient pictures of themselves being no older than the second century B C Neither are they depicted in the art of other nations The only contemporary indication we have of their personal appearance is the representation of eyes in the inscriptions and ornamentation found upon bronzes of Shang dynasty (c 1766—1122 B C) Here their Mongolian obliqueness is constantly insisted upon The accompanying illustration on the left shows such a pair of eyes upon a bronze vessel, while those on the right are typical examples of eyes used to form ideographs For whatever purpose the eye is used it is slanting the first is the ideograph for "to look" "to examine closely" the second stands for blind eyes (there is no pupil) the third, a squinting eye, in which little of the pupil is seen, gives the idea of "white," the fourth is an inscription of which the upper part is a pair of eyes It is not known where the Chinese came from originally There has been much fusion throughout their history, between the original Chinese of the Yellow River basin and neighbouring peoples

"The illustrations are many and good; the book is well balanced and clearly written and may confidently be recommended for the use of students and practitioners."—THE LANCET

Third Edition. Fully Revised & Enlarged. Large 8vo. 670 pages. 42s net postage 9d.

AN INDEX OF

PROGNOSIS

And End Results of Treatment.

Edited by **A. RENDLE SHORT**, M.D., B.S., B.Sc. Lond. F.R.C.S.Eng. Late Assistant Surgeon and Pathologist, Bristol Royal Infirmary; Late Lecturer on Physiology, University of Bristol.

In conjunction with 23 Distinguished Contributors

"A valuable addition to an important and difficult branch of medicine."—LANCET

"We know no other guide in which the practitioner or specialist can find with so little labour as much that is authoritative and to the point in connection with which will give him advice, help and information as to the best line of treatment."—BRITISH JOURNAL OF SURGERY

London **SIMPKIN & CO Ltd** Bristol **JOHN WRIGHT & SONS Ltd**

NEW EDITION

SQUIRE'S

PHARMACOPŒIAS of the LONDON HOSPITALS.

NINTH EDITION Published by J. & A. CHURCHILL, 7, Great Marlborough St., London, W.1

Foolscap 8vo Pp. 151 Price 12s 6d. per copy Postage 5d.

"A systematic comparison of the formulæ of thirty one of the London hospitals including the Children's Hospital and the French Hospital. The formulæ are arranged under the headings of the various preparations so that an immediate comparison may be made between the prescriptions of the different institutions.

The British Medical Journal says — The value of the book to the medical profession is even greater than that of its predecessor since it comprises a practical compendium of all the best medical treatments."

The Lancet says — There can be no question of the practical utility of a book which presents an exhaustive comparison of the Pharmacopœias of the London hospitals in this instance will be welcomed for the best reasons while the knowledge of the day can furnish while the reviewers represent leading authorities on all therapeutic questions."

Pure Wool Sheets

The public often assume that a wool sheet is merely a modified blanket and are inclined to reject it on that account The actual facts are —

1 A wool sheet is of lighter smoother fabric even than the flannel shirt worn next the skin Jaeger Wool Taffeta especially has a surface as smooth as cotton
2 It conducts heat very much less than cotton and is therefore cooler in Summer and warmer in Winter
3 It is delightfully comfortable helps to retain health and is of particular value for an invalid

White or Undyed Natural "Taffeta weave for Single Bed **43/6** each, for Double Bed **75/-** each

Intestinal Disinfection

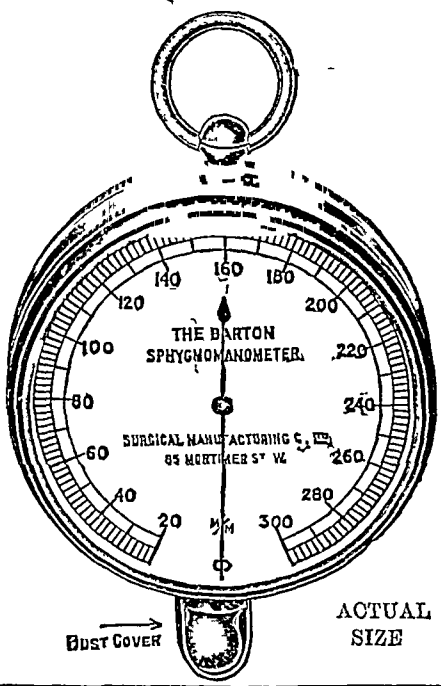
No. 6

ALIMENTARY TOXÆMIA AND NEURASTHENIA

NEURASTHENIA is no doubt a comprehensive term which includes several affections of different ætiology

In many of the cases alimentary toxæmia plays a considerable part, the digestion is upset and flatulence is frequent, the bowels are fickle in their action and the indican and ethereal sulphates in the urine are markedly increased —sure signs of putrefactive changes in the bowel

In this class of cases intestinal disinfection is one of the principal lines of treatment to be adopted, and for this purpose nothing surpasses the use of KEROL CAPSULES



For intestinal disinfection, use Kerol Capsules (keratin-coated), they contain 3 minims of Kerol One to three Capsules may be given three or four times a day after meals

KEROL CAPSULES

Please send for literature and samples which will be sent free to any member of the Medical Profession

ADVANCE IN TREATMENT of *Hyperchlorhydria and Associated Conditions*

TRADE MARK **ALOCOL** BRAND

Colloidal Hydroxide of Aluminium

Modern medical experience has proven that while the usual alkalis and oxides possess power for neutralizing the normal or abnormal acids of the stomach their action is only symptomatic and transitory They may give momentary relief to the painful condition but they also have the effect of aggravating the morbid condition. For this reason they are distinctly contra indicated especially in stubborn cases

Alocol does not neutralize acid it absorbs the excess colloido-chemically and at the same time leaves a sufficiency for normal gastric digestion The outstanding advantage of Alocol as an antacid is that it removes from the stomach the excess of the acid radicle (Cl) instead of merely temporarily neutralizing it Alocol can be used for prolonged periods without the slightest harmful effect

A supply for clinical trial with full descriptive literature sent free on request.

M. 197

'Alocol is indicated in all conditions in which diagnosis reveals high gastric acidity It is particularly valuable in the treatment of chronic affections of the stomach the dyspepsias especially those of pregnancy gastric and duodenal ulcer gastrosuccorrhea and in conditions characterized by gastralgia pyrosis, flatulence acid eructation and other symptoms common to gastric disease.

PROCEEDINGS OF SECTIONS AT THE ANNUAL MEETING, BRADFORD, 1924

SECTION OF MEDICINE

W LANGDON BROWN, M.D., F.R.C.P., Vice-President, in the chair

DISCUSSION ON JAUNDICE

OPENING PAPERS

I.—J. W. McNEE, D.S.O., M.D., D.Sc., M.P.C.P.,
Deputy Director of the Medical Unit, University College Hospital

INTRODUCTION

THE selection of jaundice as one of the subjects for discussion at this meeting implies that there may be something new to say on a symptom of disease which has always been a favourite clinical study, and, since the time of Virchow, a frequent source of pathological controversy.

About a year ago I published a review of the chief advances which had been made in the study of jaundice during the past ten or fifteen years.[1] The present account must be in some way a repetition of the other, but on this occasion I wish to deal more particularly with the practical application of the new facts to medicine and surgery. It is strange to note when the frequency of jaundice as a symptom of many diseases in this country is considered how little practical attention has been paid here to the recent changes in opinion, and the time seems to have arrived for the teaching on this subject in British medicine to undergo some revision.

As landmarks in the modern literature of icterus in this country I would choose first William Leggo's book on *Bile, Jaundice and Bilious Diseases* published in 1850.[2] Next the experimental work of William Hunter (1901)[3] *on* the relation of the spleen to blood destruction and of blood destruction to jaundice must be noticed, and it is only now that the value of this work in its relation to haemolytic jaundice can be fully appraised. Finally, I would refer to the last edition of Sir Humphry Rolleston's book published in 1912, as one of the best known standard accounts of the views then held on all appertaining to icterus.

There has certainly been no lack of stimulus to the clinical study of jaundice in Britain, and in recent years several quite new clinical varieties have attracted interest. In England during the war icterus, due to poisoning with T.N.T. (trinitrotoluene),[4] and with "dope" for aeroplane wings (tetrachlorethane) (Willcox,[5] Willcox, Spilsbury, and Legge[24]), was at one time troublesome. In France there was an outbreak of spirochaetal jaundice (Stokes and Pyle,[22] Dawson, Hume, and Bedson,[5] McNee[14]) and in the East "campaign jaundice" was at times epidemic (Willcox).[5] Further, from the time of Ehrlich's discovery of salvarsan in 1909 jaundice has always been one of the most frequent and important complications in the treatment of syphilis with arsenobenzol compounds.[6]

In spite of these clinical opportunities, however, it must be admitted that the chief recent advances in our knowledge of the pathology of jaundice have come from America, France, Germany, and Holland, comparatively little having been done in our own country. The work which in recent years has had most influence in developing our knowledge of jaundice may now be briefly outlined.

NEW WORK ON JAUNDICE

The Work of Hijmans van den Bergh

We are, I understand, to be singularly fortunate at this meeting in having with us Professor Hijmans van den Bergh[7][10] of Utrecht, to whom is due undoubtedly one of the most important recent developments. The basis of this advance was simple, but involved the solution of a problem which had long baffled others. It consisted in the development of a delicate method by which small amounts of bilirubin could be detected and measured quantitatively in small amounts of albuminous fluids such as blood serum. Not only that, but by this method, which already fairly well known in this country, qualitative differences in the bilirubin present in the serum in different clinical forms of jaundice were also made out, thus giving an entirely new means of approach to the investigation and subdivision of different forms of jaundice.

It is fair to point out that Professor van den Bergh must only be held responsible for the development of the method itself and for the main results obtained by its use. For many modifications of his original methods, and for theories that have been founded either in whole or in part on observations made by them, others must bear the responsibility. I wish, however, to emphasize one fact—that by means of this reaction for the recognition of bilirubin in serum a fundamental change in our attitude towards jaundice has been brought about. Our attention has been taken away from the mere colour of the skin and mucous membranes and from the presence or absence of bile pigments in the faeces and urine, *to what is occurring in the blood*. This is a fundamental point, and how just the same trend as has been manifested in recent times in the clinical investigation of diabetes mellitus and nephritis. In these we have learned the importance of the "blood sugar" and "blood urea". We may now add, in diseases associated with jaundice the "blood bilirubin".

That is all that is needed by way of introduction of Professor Hijmans van den Bergh's work, since it will be dealt with much better by himself. I wish, however, to bring his observations into the foreground because of their importance, and because reference must so often be made to results obtained by his methods.

The "Reticulo-endothelial System" in Relation to Jaundice

The term "reticulo-endothelial system" is of recent introduction into pathology, and was applied by Aschoff[11] to a system of endothelial cells scattered widely through the body but having very specialized activities in certain situations. So far as jaundice is concerned the cells of this system which chiefly interest us are the endothelial cells lining the sinusoids of the spleen and the endothelial cells of von Kupffer which line along the various capillaries of the liver. Similar cells in the bone marrow are probably also of subsidiary importance. The importance of discussing this system is to enable us to understand recent research work on the metabolism and sites of formation of bile pigment in the body in relation to a reconsideration of the whole question of haemolytic icterus and of the forms of toxic and infective jaundice in which obstruction of the bile ducts is not clinically or pathologically evident. In order to understand the facts that have been made out and a new theory concerning these varieties of jaundice which has been founded on them, it is essential to recall to mind the finer histological structure of the hepatic lobule. Here I wish to point out our great indebtedness (freely acknowledged in all foreign textbooks—for example, Oppel[12]) to Lionel S. Beale of King's College Hospital, whose lectures on the structure of the liver were first published about 1856.[13] My own view of the hepatic lobule is founded partly upon Beale's observations, and also on personal examination of the livers of many animals, birds, and reptiles from the Gardens of the Zoological Society of London, to which society and their pathologist, Dr. N. S. Lucas, my thanks are due for the material provided.

Each lobule can be considered schematically as made up of a series of radiating tubular glands, shaped like a test tube, with the closed end pointing to the centre of the lobule. The polygonal glandular cells lie, as it were, along the wall of the test tube, which may be taken to represent a basement membrane. In the centre of the test tube, surrounded *entirely by the polygonal cells*, lies the bile

* I believe I was the first in this country to call attention to van den Bergh's use of the diazo-reaction and I take this opportunity to correct a small error which slipped into my description. In the first solution for the diazo-reaction the amount of sulphanilic acid (3 g.) is 1 gram per litre and not 1 c.c. as was printed in error. A full account of the technique and of some suggested modifications by others is given in the work already mentioned.

capillary. Reference to the diagram will make this description clear, and it will be seen that the bile capillary begins, near the bottom of the test tube, at a blind end. Between the tubular glands run the wide portal vascular capillaries, passing from the portal tract to join the branch of the hepatic vein in the centre of the lobule. Along the walls of these capillaries lie a number of large endothelial cells (Kupffer cells) which form an important part of Aschoff's "reticulo-endothelial system." These cells of von Kupffer are very abundant in birds and some animals, but are less numerous in man.

The experimental production of icterus in birds (McNee, 1912-13[11]), following blood destruction induced by arseniuretted hydrogen, seemed to show that in these animals the cells concerned in the breaking down of haemoglobin and elaboration of bile pigment were the Kupffer cells of the liver (which in birds are very numerous) and the reticulo-endothelial cells of the spleen, and not the polygonal cells of the liver. In birds in which the liver had been extirpated no real icterus followed the blood destruction, and this was interpreted as being due to removal of the Kupffer cells in the liver, and to the small size and poor development of the spleen in birds. It is of interest that these experiments, which suggested a reconsideration of the question of haemolytic jaundice, began as a repetition of the well known work of Minkowski and Naunyn in 1886[2]. These observers, finding that no jaundice occurred after poisoning with arseniuretted hydrogen and removal of the liver, simply concluded that the liver was essential to the development of icterus, and as a result of the wide acceptance of their experiments the recognition of a true haemolytic jaundice, apart from the liver, was put aside for a whole generation.

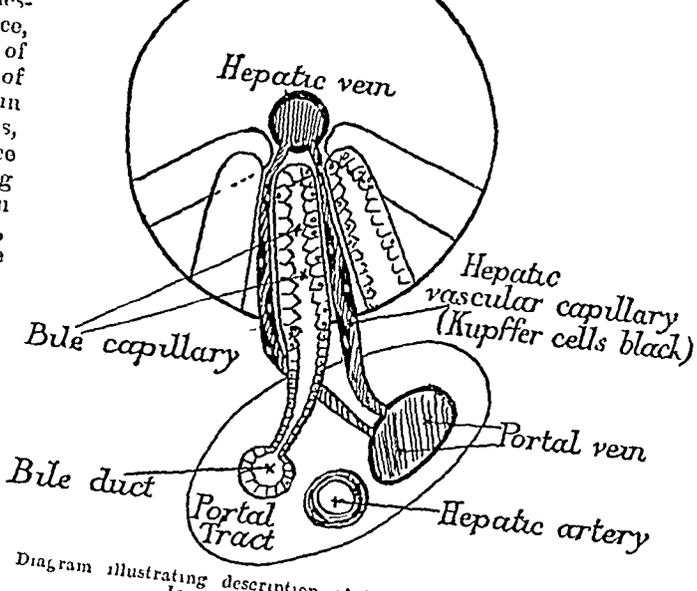

Diagram illustrating description of lobule. (From the *Quarterly Journal of Medicine* by permission.)

The new work suggested a reconsideration of the whole subject, and the view that it is the reticulo-endothelial cells which are concerned in the production of icterus by haemolysis, and not the glandular cells of the liver, has been supported by Lepehne[12] and many others. It was obviously essential, for the furtherance of these views, that equivalent experiments should be done in higher animals, where the spleen is more developed and the liver contains fewer Kupffer cells.

Work of Whipple and Hooper, and others, in America.

The problem seemed solved by the important experiments of Whipple and Hooper[10] in dogs, in which the question of a true haemolytic jaundice, quite apart from the liver, was subjected to very direct experiment. The critical experiments of these writers were in dogs in which only a "head and thorax" circulation remained, all the viscera below the diaphragm, including the liver, being cut off completely from the circulating blood, although left *in situ*. In such animals Whipple and Hooper found that haemoglobin when introduced into the limited circulation of the head and thorax, was changed readily, within a few hours, into bile pigment. Bile pigment was not only recognized in the blood serum, but an actual icterus of the thoracic subcutaneous tissues was observed.

It was obvious that these important experiments, if confirmed, finally put the occurrence of a true haemolytic jaundice outside or and independent of the liver on a firm basis.

An attempt to confirm the experiments has been made within the past two years by Rich,[14] and by McNee and Prusik,[15] but in neither set of experiments could a confirmatory results be obtained, even with the great additional advantage of the van den Bergh reaction for the recognition of bilirubin in blood serum. Rich has made criticisms of the operative technique, while Prusik and McNee were unable to obtain positive results even by following as closely as possible the method described.

Now it seems again as if proof was really forthcoming in the work of Mann and others, of the Mayo Clinic,[16 19 20] part of which has been recently published and part of which is still unpublished. Mann's work on this question formed part of an investigation into the general physiology of the liver, in the course of which he devised a new technique for the total extirpation of the liver in dogs. The operation is a difficult one, carried out in three stages, and the whole experiment, if successful, takes about two months at least before the final operation, at which the liver is completely removed from the body, with less shock to the animal than in all previous methods. In animals from which the liver has been extirpated in this way life may be prolonged for periods up to twenty four hours, provided that glucose be injected to keep the blood sugar at the normal level. This is much longer than any of the higher animals have hitherto been kept alive after total removal of the liver. Mann found that in these animals bile pigment appeared in the blood serum and also in the urine within a few hours after the liver had been removed.

This, then, is the stage which the *direct experimental* proof of a true haemolytic jaundice has reached, and a definite answer may be expected soon.

We may suitably consider here whether there is any *clinical* proof of the occurrence of haemolytic icterus outside the liver. The best evidence that can be offered at present has only shown itself clearly since the introduction of the method of van den Bergh, and depends on the observation of the gradual appearance of bilirubin in haemorrhagic effusions in the various body cavities, and especially in joint cavities. I have myself examined the fluid from an extensive haemorrhage into a previously healthy knee-joint eight days after the injury, and found the indirect van den Bergh reaction positive to the extent of eleven units. Here it seems certain that the liver cells could have had no share in the transformation of haemoglobin into bile pigment, and many examples of a similar kind could be given from the writings of van den Bergh,[17] Lepehne,[12] and others. It must be admitted, however—and this is perhaps a fundamental point—that no general icterus of the skin and subcutaneous tissues develops in these cases, however large the effusion and extent of bilirubin production. It may be, of course, that bilirubin formed in this way does not readily pass out from the serous cavity, but on this point we are not yet well informed.

Other important work having an indirect bearing on the reticulo-endothelial system, especially as contained in the spleen in higher animals, has been carried out in America by Pearce,[21] in association with many colleagues. This work has dealt with the relation of the spleen to blood destruction and to haemolytic jaundice, previously considered by William Hunter (1901), and is dealt with at length in Pearce, Krumbhaar, and Frazier's book, *The Spleen and Anaemia*.[22] Moreover, so well does the new knowledge concerning the activities of the reticulo-endothelial system agree with the clinical pathology of the group of diseases associated with splenomegaly, anaemia, and icterus that

Lippinger, in a recent monograph, includes these diseases under the title *Die hepato lienaler Erkrankungen*, or liver-spleen diseases.

Disordered Hepatic Function (Hepatitis)

The view that jaundice may arise from disordered function of the liver cells, or hepatitis, has been developed chiefly in France (Brule, etc.), and clinically this explanation has been offered to account for the development of jaundice in *toxic and infective states*. *This explanation infers that* although the cells of the reticulo-endothelial system may be chiefly concerned with the metabolism of bile pigment, yet the polygonal glandular cells of the liver must be healthy in order that bilirubin may pass through them and so reach the bile capillaries.

This question of disordered function of liver cells was fully discussed at the Annual Meeting in Glasgow two years ago, and the varieties and extent of the cellular damage defined. It was then pointed out that the injury might vary from cloudy swelling to actual and complete necrosis, and that clinically the hepatic insufficiency associated with jaundice might range from slight and temporary (as in acute specific fevers) up to total and fatal (as in acute yellow atrophy). The French school has also considered, in conjunction with the disordered metabolism of bile pigment, alterations in other hepatic functions, and in this way has arisen their conception of so-called 'dissociated jaundice." In this condition bile pigments may be retained, while the bile acids are excreted normally, or vice versa.

A NEW THEORY OF JAUNDICE

On the view that it is the cells of the reticulo-endothelial system which elaborate bile pigment, and that the polygonal cells of the liver are chiefly concerned with its passage into the bile capillaries, a new theory of jaundice has been developed. As an explanation of the two varieties *of bilirubin* distinguished by the "direct" and the "indirect" van den Bergh reaction, it has also been suggested that the bilirubin in passing through the glandular liver cells is modified in some way.

On the basis of this theory we may now consider in what circumstances icterus could arise. The following conditions may be enumerated:

1. Where bile pigment, formed in the cells of the reticulo-endothelial system, passes through the polygonal cells normally to reach the bile capillaries but is obstructed there and finally reabsorbed into the *blood*.
2. Where, owing to damage to the polygonal cells of the liver, the bile pigment carried to them by the endothelial cells is *unable* to enter them. The bilirubin would therefore pass directly along the hepatic venous radicles into the general circulation. On the other hand, part of the bilirubin might pass through, and part be unable to do so.
3. Where, in excessive blood destruction, too much bilirubin is formed in the reticulo-endothelial system for the polygonal cells to deal with. In such circumstances some pigment might pass normally into the bile capillaries and colour the faeces, while the excess might pass straight through the hepatic cells into the circulation and bring about jaundice.
4. Where, in addition to damage and disordered function of the polygonal cells, there is also obstruction in the bile ducts—for example, cholangitis. In such circumstances some pigment might pass directly through the hepatic cells into the circulation and some through the polygonal cells to be afterwards reabsorbed on account of obstruction.

What might occur in the event of damage to the cells of the reticulo-endothelial system? While we have no clinical diseases which at the moment would appear to be due to the disordered function of the reticulo-endothelial cells, there is experimental evidence from Lepehne that the blocking of this system by means of *innocuous silver compounds* may hinder the development of experimental haemolytic icterus. It seems possible that some of the conditions associated with haemoglobinuria rather than icterus (for example, blackwater *fever*, and some poisons) may later be brought into this category.

THE CLINICAL VARIETIES OF JAUNDICE

Before going on to consider how this new theory agrees with the facts, which after all is the critical test, it seems best for clearness in subsequent argument to give some classification of the different forms of icterus and I [illegible] suggested that in the present state of our knowledge the following is the most suitable and comprehensive arrangement:

(1) Obstructive hepatic jaundice.
(2) Toxic and infective hepatic jaundice.
(3) Haemolytic jaundice.

It will be found that all clinical varieties of jaundice can *readily be made to fit into this classification*, when considered in the light of the theoretical considerations described above, and in the light of the van den Bergh tests. Some clinical forms, it is evident, must be placed in two or three divisions, as, for example, when toxic changes in the liver cells are combined with definite obstruction in the bile passages. The inclusion of the word "hepatic" *in (1) and in (2) is deliberate, and intended to indicate that* the lesion is within the liver itself, either in the polygonal cells or in the bile capillaries. The omission of this word under (3) is equally deliberate, so as to indicate that the reticulo-endothelial system is by no means confined to the liver, but in higher animals is largely developed within the spleen.

The van den Bergh Reaction in the Classification of Jaundice

It will be found that the grouping of jaundice given above agrees well with the results of the van den Bergh reaction.

Hepatic Obstructive Jaundice.—Hijmans van den Bergh showed that bile from the gall bladder gives a prompt direct reaction with the diazo-test, and that the same result is obtained in icterus due to complete obstruction of the bile passages—that is, when bile has passed through the *polygonal cells before obstruction* and absorption occurs (No. 1).

Haemolytic Jaundice.—He showed also that in clinical haemolytic jaundice and in the bile pigment produced in haemorrhagic effusions into serous cavities a delayed or negative reaction is obtained with the diazo-test. It is *suggested on the theory* of jaundice described that this result occurs when bile pigment has not passed through the polygonal hepatic cells (No. 3).

Toxic and Infective Hepatic Jaundice.—In the toxic and infective types of jaundice Feigl and Querner showed that the van den Bergh test gives a biphasic result, which has been interpreted as a combination of the prompt-direct and the delayed-direct reactions. The explanation is offered, on the theory of icterus described, that in such toxic and infective conditions some bilirubin has passed through the hepatic cells normally, while some, owing to the damage of the polygonal cells, has reached the circulation direct from the reticulo-endothelial cells (No. 2).

Combined Forms of Icterus.—As an example, so-called catarrhal jaundice may be taken. In this type of icterus the results of the van den Bergh reaction are very variable at different stages of the disease. Here it is suggested (vide infra) that the mechanism of the jaundice is a combination of functional derangement of the liver cells with obstruction due to cholangitis (No. 4).

How have these New Views and Methods Modified the Old Ones and how have they Improved the Clinical Observation of Icterus?

The clinical use of the van den Bergh reaction has given us much new and valuable information by a study of the bilirubin in the blood. It is possible now to *trace completely* the whole progress of an attack of icterus. We know now that the colour of the skin and mucous membranes is a poor guide, and that much bilirubin may be present in the blood at a time when there is scarcely any general icteric tinge. We have come to recognize also that "green" or "black" jaundice must now be taken merely as a clinical expression of chronicity, and not of the amount of bilirubin retained in the blood. Further, we have learned the importance of "latent" icterus—a condition in which, in the *obstructive variety* there is sufficient bile pigment in the blood to make the patient obviously yellow or to bring about bilinuria. It is now known that in this form of latent icterus at least four van den Bergh "units" must be present in

the serum before the threshold value of the kidney for bile pigment is reached and bilinria results Cirrhosis of the liver may be quoted as an example of latent obstructive jaundice Moreover, diseases not hitherto considered in the light of their icteric nature at all have now, since the introduction of the van den Bergh reaction, been brought into the category of latent haemolytic jaundice The best example of this kind is pernicious anaemia, where a lemon-yellow colour of the skin was always recognized, and in which we now know bilirubin is present in the serum to the extent of two to five van den Bergh units It is a suitable place here to point out that in haemolytic jaundice the threshold value of the kidney for bilirubin is entirely different from that existing in jaundice due to obstruction In all cases where the bilirubin gives an "indirect" reaction (for example, haemolytic icterus), for greater quantities than four units of bilirubin may be present in the serum without a trace of bile pigment being excreted by the kidneys It seems possible that in both varieties of latent jaundice, and in all varieties of overt haemolytic jaundice, the bilirubin is excreted as urobilin, in whole or in part, but this is a matter on which further work is required

As an example of the practical application of our new knowledge of latent icterus, recent investigations by Gerrard[8] in cases of syphilis undergoing treatment with salvarsan are of much interest Jaundice as a complication of salvarsan treatment is well known, and this observer, by routine examination of the blood, has been able to watch the development of latent icterus, in susceptible individuals, and stop the administration of the drug before actual icterus ensued Finally, the van den Bergh reaction gives us a definite method of distinguishing jaundice due to complete obstruction from haemolytic icterus In icterus due to incomplete obstruction, and in the toxic and infective forms, it yields no information of absolute diagnostic value to the clinician

The new view of the activities of the reticulo-endothelial system has greatly influenced our attitude towards the forms of jaundice associated with splenomegaly, conditions which Eppinger has grouped on the basis of this view under the name of "liver-spleen diseases" (*Die hepatolienalen Erkrankungen*) The cure of such diseases by splenectomy—that is, by the removal of the main site of the reticulo-endothelial cells—in man and higher animals is in accord with this theory Further, the theory gives us the most obvious explanation of the two varieties of the van den Bergh reaction, and seems to show reasonably how this reaction enables us to distinguish obstructive from haemolytic jaundice

SUMMARY, AND POINTS FOR DISCUSSION

The term "jaundice" has been used as far as possible in its strict sense, to indicate a disorder of bile-pigment metabolism Reference to changes in other constituents of the bile, and to other hepatic functions, have been omitted as making the discussion too wide

A new theory of jaundice is described, which it is suggested may replace, as a working hypothesis only, the older classical views

A classification is suggested, based on the new theory and on clinical observation of diseases associated with icterus

The observations of Hijmans van den Bergh on the bilirubin in the blood, the activities of the reticulo-endothelial system in bile-pigment metabolism, the results of animal experiments in relation to the occurrence of a true haemolytic jaundice, and the conception of disordered function of the glandular cells of the liver as a cause of jaundice, are all discussed

The following points, among others, seem to invite discussion

1 How far does the theory of jaundice which has been suggested agree with observed clinical facts?

2 How has the reaction of Hijmans van den Bergh modified our clinical attitude towards jaundice, and what is the meaning of the two varieties of bilirubin apparently differentiated by the test?

3 What view is to be taken with regard to "haemolytic jaundice," and to Eppinger's inclusion of certain diseases under the descriptive term "liver-spleen diseases"?

4 What is the exact mechanism of one or the commoner forms of jaundice met with in this country—e.g., "catarrhal jaundice"?

5 How important in clinical medicine may be the recognition of (*a*) latent jaundice, and (*b*) dissociated jaundice?

6 How far do these new views influence medical and surgical treatment?—

(*a*) Jaundice and splenomegaly

(*b*) Differentiation of obstructive from other forms of icterus

(*c*) Protection of the glandular cells of the liver (by glucose, etc.) against toxic and infective agents (chloroform, salvarsan, microbic infections)

II.—HIJMANS VAN DEN BERGH, M.D.,

Professor of Medicine and Director of the Medical Clinic, Utrecht

I FEEL highly honoured by your invitation to take part in a discussion on jaundice I sincerely hope that you will not regard those words as a mere form of courtesy You are a great nation, and have had at every period in your history a great number of eminent physicians Whenever you invite a colleague from abroad to interchange views you are conferring a great honour on him

As Dr McNee has already pointed out, it is not necessary to go as far back as Budd or Murchison in order to cite authoritative writers in England on diseases of the liver He very justly reminded us of the standard work of Sir Humphry Rolleston in 1912, which expounds the state of our knowledge at that time better than any other work on the subject, and contains numerous important observations of his own Dr McNee also alludes to the classic work of Dr William Hunter, which forms a starting point for every student of pernicious anaemia As a matter of fact his book was the stimulus that induced me to study haemolysis

It was Dr McNee himself who originated a new direction in our views upon the production of jaundice It was he who first pointed out that it is probably the cells of the reticulo-endothelial system that elaborate the bile pigment His views were supported by Eppinger and many others I do not know any clinical observation that would not agree with his theory It is also fully in accord with my own investigations There are, however, a certain number of authors who adhere to the inference of Naunyn and Minkowski, that icterus is impossible without the liver cells We must admit that it is almost impossible to prove this statement with certainty In the human [illegible], we cannot make experiments on the liver, and it is not [illegible] impossible to separate the liver cell from the cells of Kupffer In making experiments on animals we must not forget that they may differ much from man in [illegible] the function of the liver For instance, in the [illegible] threshold of bilirubin is extremely low When [illegible]

mere traces of the pigment in the blood it appears in the urine. In all experiments upon dogs this should be kept in mind.

BILIRUBIN IN EXTRAVASATIONS

Virchow pointed out the resemblance of the haematoidin crystals of apoplectic extravasations with the crystals of bilirubin, and German authors, such as Lange, Hans and Quincke, have demonstrated the presence of bilirubin, or at least of a substance giving the Gmelin test, in haemorrhagic effusions. Particularly credit is due, however, to be given to French authors for their thorough study of the formation of such pigments in haemorrhagic effusions, and above all in this respect we are greatly indebted to Loix and to Jean Troisier. The thesis of the latter gives a full account of his own important work and of the work of other down to 1910. The diazo method permits us to study the process in a quantitative manner. In this we found that whenever there had been an effusion of blood in the tissues or in the serous cavities, it gave rise, in the course of a few days to the formation of bilirubin. This cannot have been absorbed from the blood as some authors have suggested, for the concentration of the bile pigment in the effusion is incomparably greater than in the blood serum. Doubt has also been expressed as to whether the pigment in the haemorrhagic fluids is really identical with true bilirubin. The important investigations of H. Fischer of Munich, however, have placed this beyond doubt and proved the absolute chemical identity. Now what is the reason that in the case of such haemorrhagic effusions a real jaundice never occurs?

In the first place, as Dr. McNee has pointed out, it is very probable that the bilirubin is generally not absorbed by the wall of the cavity or vessels that it does not give rise to an increase of the blood bilirubin sufficient for determinations of the blood bilirubin in such cases have, not, as far as I know, yet been made. In the few cases which have been examined in my laboratory generally no increase of the blood bilirubin was to be found, but in some of them there was a small elevation. In the older literature there are a few observations on record of ruptured extratubular uterine pregnancy (Dicq) where a slight jaundice was noticed, without the presence of bilirubin in the urine. An intense jaundice cannot be expected in such cases. There is, indeed, a fundamental difference between them and cases of obstructive jaundice. In the latter there is a constant overflow of bile into the blood, whereas in the first-mentioned condition the bilirubin is excreted by the undamaged liver cells as soon as the pigment threshold is passed. Finally, it may be that the bilirubin with indirect diazo-reaction has a weaker colouring faculty than the pigment with direct reaction. I commenced making experiments in this direction, but did not continue them. It is noteworthy that the pigment with indirect reaction is not absorbed by the precipitate of protein which forms when alcohol is added to the serum. It is well known that the bilirubin with direct reaction is absorbed in this circumstance to a high degree.

The Diazo Test

In his opening paper Dr. McNee has urged me to say some words about the diazo test. In the first place I want to emphasize the point that I do not consider the quantitative method as worked out in my laboratory to be a very perfect one. We therefore always speak about it not as a quantitative determination, but as an estimation of the bilirubin. But we do not, I think, possess a better one at present. Numerous modifications of the original method have been suggested, and my co-worker, Dr. Muller, has investigated a great many of them thoroughly, hoping to find one of them to be an improvement. He came to the conclusion that the original method generally yielded the most satisfactory results. The main drawback in making the test is that when alcohol is added to the serum the protein precipitate which is being formed carries down a part of the pigment. This, however, applies only in the serum with bilirubin in the direct reaction, the pigment with indirect reaction not being absorbed by the precipitate. The loss of bilirubin in the first case can usually be avoided by diluting the serum (for instance, ten times) with water, before making the reaction. In this way no precipitate is formed, or only a very slight opalescence, which is readily dissolved when adding the diazo fluid. It is only possible to dilute to the necessary extent when there is much bilirubin in the serum. If there is little bilirubin the reaction after dilution of the serum with water would give rise to such a faint coloration that the colorimeter could not be used in a sufficiently accurate reading. Thus we see that it is only in the serum of a true case of jaundice with poor bilirubin content that a certain difficulty in the quantitative reaction arises. In that case I perform the reaction with the undiluted serum, as suggested by Thannhauser and Anderson. The Malmgrad method, which consists in comparing the colour of the serum with a standard fluid, is certainly very simple. It may be used in some cases to advantage, but it is inadequate when the serum contains other pigments besides bilirubin, as is very often the case. This method cannot therefore be used in cases of haemoglobinuria or when artificially methaemoglobin has been introduced into the serum, through destruction of the corpuscles.

HAEMATIN IN BLOOD SERUM

I must refer also to the presence of haematin in the blood serum, which was first described by Schumm of Hamburg, and his co-workers and which is much too intricate to deal with to-day. It is not rare to find it in pronounced amounts, and also in several intoxications and in some infectious ones, such as the puerperal infection, which Schottmuller and Bingold have so clearly described. In the diazo test you will find in the serum a brown ring (for sulphaemoglobin), haematin and bilirubin. Methaemoglobin and sulphaemoglobin are detected through the spectroscope. The bilirubin can only be seen under these circumstances by means of the diazo reaction. It is of consideration should also be given to interference. Generally from these the intense yellow colour of the serum or cord is due to lutein. This pigment has to be to do with bilirubin. It is a lipochrome, which cannot be elaborated by the animal organism. Man and animals absorb it from vegetables, eggs, meat, butter, or fat. We take it when eating vegetables, especially quantities of Green plants especially contain great quantities of lutein. Lipochromes (xanthophyll and carotin), which are always present with the chlorophyll. The quantities of lutein in the human serum, although commonly small are sometimes relatively increased—as for instance, in persons who consume large quantities of vegetables and eggs. At times the amount is so great that the serum takes on a yellow tinge, and I have met with a few cases in which gall-stones had wrongly been diagnosed and the patient been sent to hospital, the xanthosis of the lutein being considered to be a beginning jaundice. It is of value to a clinician that bilirubin and lutein can be distinguished from each other. I am sure that such cases occur more frequently than is generally supposed. It is quite easy to produce artificially a pseudo-jaundice. You have only to make a man eat much green vegetable during a few weeks. We took with us the serum of a diabetic man fed in that way.

LATENT ICTERUS

In his points for discussion Dr. McNee has asked: How important may be the recognition of a latent icterus? In our clinic we look upon this examination as indispensable. Occasionally it enables us to ascertain that a metastatic carcinoma is developing in a lymph gland and compressing the bile ducts. In such a case an increased bilirubin content of the blood may point to the beginning or failure of compensation. It is exceedingly important in making the diagnosis between pernicious or like other anaemias and the so-called secondary anaemias. In pernicious anaemia one finds always, except in the case when the patient is getting better, an increased bilirubin content. Even when the patient is improving we have often found subnormal values. In the secondary anaemias, on the contrary, except in complication, we hardly find bilirubin. This is for instance, in the anaemia caused by tapeworms, by haemorrhages, by worms (I do not propose to discuss the anaemia of bothriocephalic diseases here.) In chronic nephritis there is generally a low bilirubin content, and when finding a high value with diazo reaction, suspicion of

beginning heart failure is, I suppose, justified During an attack of malaria the bilirubin content was found increased with indirect reaction In the paroxysm of haemoglobinuria *a frigore* an increase of the bilirubin in the blood also occurs, a German author, Dr Kaznelson, was able to produce in such cases slight attacks of haemolysis, in which haemoglobinuria had not yet appeared, the bilirubin content of the blood being already high

The Two Varieties of Bilirubin

Finally, I will say a few words concerning the two varieties of bilirubin I think we must neither attach an exaggerated value to it nor deny its importance altogether Two things are certain there exists a difference between the two modifications, and we do not know the cause of it Some authors have laid stress upon the fact that through the action of alkali, or simply by leaving the fluid alone for some time, the one modification can pass into the other This only proves that the direct and the indirect modifications are chemically very nearly related Such slight chemical differences, however, may be the cause of important diversity in biological action To give an example the alpha, beta, and gamma modification of glucose It is true, also, that generally in cases of mechanical jaundice the one modification is found, and in cases of haemolytic anaemia, just as in haemorrhagic effusions, the other It is not justifiable to impute this diversity to the fact that the direct reaction occurs when there is a great quantity of bilirubin and the indirect reaction in the opposite condition, as Brule has suggested Indeed, in almost every case of haemolytic jaundice, even when the bilirubin content of the blood was as high as 10, 14, or 18 units, the reaction was found to be only indirect, whereas we met with patients with obstructive icterus whose serum had a bilirubin content of from 1 to 5 units with a prompt-direct reaction On the other hand, we must not overestimate the theoretical significance, as long as the cause of the difference is unknown to us I wish also to emphasize the fact that we meet from time to time exceptions to the rule, now and then a case of beginning or disappearing obstructive jaundice occurs in which the reaction is direct These exceptions can be partly explained, in accordance with the theory of Dr McNee, by the fact that probably in such cases the liver cells, being damaged, let pass a bilirubin that is not yet completely elaborated Consequently many a time a mixture of both of the bilirubin modifications may be expected to pass into the blood Nevertheless, from time to time—and I wish to lay stress upon this point—we meet with exceptions which we are as yet unable to explain

---

III—Sir WILLIAM WILLCOX, K C I E, C B, C M G, M D, F R C P,

Physician to St Mary's Hospital

The most modern views on the theory of jaundice have been very ably expounded by Dr J W McNee, and the medical profession owes him a debt of gratitude for his admirable opening paper and for his critical review of jaundice published in the *Quarterly Journal of Medicine* in July, 1923

In the Lettsomian Lectures on jaundice in 1919 I stated that further advances in our knowledge of jaundice would depend very largely on the discovery of accurate quantitative methods for the estimation of the bile pigments and bile salts in the blood Professor van den Bergh, by his brilliant discovery of the methods of the quantitative estimation of bile pigments in the blood, has opened up a new field of work in the pathology of jaundice, and the advances made during the past five years have been in a great measure due to his research We welcome most heartily his presence among us and the British Medical Association is greatly honoured by his participation in this discussion

Dr McNee has classified jaundice into three groups (1) obstructive hepatic jaundice, (2) toxic and infective hepatic jaundice, and (3) haemolytic jaundice With regard to (1) obstructive hepatic jaundice, there will, I think, be little difference of opinion In reference to (3) haemolytic jaundice, it will, I think, be generally agreed that this type of jaundice undoubtedly occurs, though it is relatively uncommon clinically

The evidence forthcoming from the animal experiments is open to some criticism Take, for example, the experiments on dogs made by Whipple and Hooper, where the vessels below the diaphragm were excluded from the circulation They were said to prove that bile pigment could be formed without the agency of the abdominal viscera when haemoglobin was introduced into the circulation Dr McNee himself, and also Rich and Prusik, failed to confirm these results Quite recently Mann and others of the Mayo Clinic have succeeded in the operation of extirpation of the liver in dogs A preparation lasting three months is required, and then when the operation of extirpation is completed the animal only lives for twenty-four hours as a maximum, and probably much less, life being maintained for this short period by glucose injections Surely the metabolic processes in a moribund dog must be so altered during the few hours of its existence under very abnormal conditions that conclusions drawn from the presence of traces of bile pigments in the circulation can be of little value, especially when these conclusions are applied to the human subject

Then, again, I do not think that importance can be attached to the presence of a van den Bergh reaction in haemorrhagic effusions into a knee-joint, or similar effusions into other body cavities It has been known for years that haematoidin, which is closely allied to, if not identical with, hydrobilirubin, is formed in such effusions, and it would be surprising if the van den Bergh reaction were not given Conditions of this kind are, to my mind, not comparable with jaundice as defined by Osler—namely, "a coloration of the skin, mucous membranes, and fluids of the body by bile pigment"

I think that far the best evidence of the production of true haemolytic jaundice is to be found on the clinical side Acholuric jaundice is one of the best examples In this condition if the spleen be removed the jaundice disappears, which is good evidence that the production of bile pigment in these cases took place in the spleen and not in the liver Histological researches afford strong confirmation of this view

Take, again, the effects of arseniuretted hydrogen on man In this condition great blood destruction occurs and also jaundice, but it has been shown by Dixon Mann and Cleg that in some of these cases so little damage to the liver occurs that the jaundice cannot be hepatic in type, and must be haemolytic

Many of us are familiar with cases of severe anaemia due to intestinal infection where each relapse is associated with an attack of enterocolitis Hunter calls these cases septic anaemia, and the blood picture may be identical with that of pernicious anaemia I have at present under my care a patient who has recurring attacks of enterocolitis due to a haemolytic streptococcal infection Each attack is associated with definite jaundice and marked increase in the anaemia, but no hepatic signs whatever are present In cases of this kind the jaundice must be haemolytic and not hepatic in type

Toxic and Infective Hepatic Jaundice

It matters not whether the jaundice is due to an exogenous poison like salvarsan or the autogenous toxins of bacteria or protozoa This type of jaundice is, I think, far the most important and the commonest The following is a classification of the causation of this type

1 *Chemical poisons*—such as tetrachlorethane, trinitrotoluene, dinitrobenzene, dinitrophenol arsenobenzol derivatives, inorganic arsenic and antimony compounds, phosphorus arseniuretted hydrogen phosphoretted hydrogen, chloroform, phenylhydrazine, toluylenediamine, and many others

2 *Bacterial poisons*—such as the toxins produced in enteric and paratyphoid fevers, typhus fever, influenza, pneumonia, streptococcal infections, etc

3 *Protozoal poisons*—such as the toxins produced in malaria, yellow fever, spirochætosis icterohæmorrhagica, kala azar, amœbic dysentery, malaria etc

4 *Auto-intoxications*—such as the changes in the liver in pernicious anæmia, recurrent vomiting, etc

The explanation of this type of jaundice is, I believe, to be found in the consideration of a function of the liver which has not been sufficiently recognized, though

it is one of the most important. I refer to the 'toxiphylactic function of the liver.' The liver is the organ which is mainly responsible for removing poisons, whether exogenous or endogenous, from the blood stream. It is the main protective organ of the body from poisons of all kinds and in carrying out this function the liver cells may suffer, and indeed irreparable damage may be produced, so that the liver may lay down its life in the defence of the body from its influence. The liver is the first line of defence against absorbed poisons.

This statement is made as the result of a toxicological experience extending over twenty-five years. In cases of arsenical poisoning or poisoning by the heavy metals such as mercury or lead, or of organic poisoning—for example chloroform, phenol, and trinitrotoluene—or of alkaloidal poisoning such as by strychnine, morphine, or hyoscine, the greater part of the poison in fatal cases is found in the liver.

When submitted to toxic influences the liver cells are inevitably affected, commonly cloudy swelling or fatty deposition occurs in them, or they may undergo complete necrosis. In all of these instances the passage of bile to the bile capillaries is interfered with and jaundice of varying degree is produced.

The depth of jaundice is no measure of the severity of the toxic action. In very acute cases such as delayed chloroform poisoning, acute salvarsan poisoning, and phosphorus poisoning, the damage to the liver may be so great that its function is almost completely abrogated (see experiments of Mann on extirpation of the liver), and death occurs before jaundice of the skin and mucous membranes becomes marked, though its presence can be detected if looked for. In less acute cases jaundice may be so marked as to be indistinguishable from obstructive jaundice. The stools are often clay-coloured for a few days and the urine loaded with bile pigment. This was well shown in the cases of jaundice from tetrachlorethane published by me and also in cases of trinitrotoluene poisoning, and many cases of salvarsan jaundice under my care. Cases of this kind are often mistaken for "catarrhal jaundice." The fact that the liver is at fault may always be demonstrated by one of the tests for hepatic deficiency. The most convenient of these is the lævulose test when a marked positive reaction is shown by the blood sugar curve.

It must be remembered that the depth of the jaundice *coloration is not a measure* of the degree of hepatic deficiency. This jaundice may be deep and the hepatic efficiency approximately normal. In toxic jaundice the hepatic deficiency test may be only positive for a few days during the existence of the jaundice, which may extend over a period of weeks.

The Time Factor of Jaundice

It is most interesting to note that after the action of some toxic substance on the liver the time of occurrence of jaundice is most variable. In some cases the onset may be early, within a few days, but in others it may be much delayed. Thus in salvarsan poisoning jaundice may occur weeks or months after the last administration. I have notes of cases in which jaundice came on from ten to sixty-four days after the last administration, and much longer intervals could be quoted.

Two cases of trinitrotoluene poisoning are recorded where the jaundice occurred nine months after exposure to the poison. A probable explanation of delayed jaundice is that the poison sets up a progressive hepatitis which ultimately culminates in jaundice. In delayed salvarsan jaundice an additional explanation might be found in the reabsorption in the liver of arsenic which had become temporarily fixed in the epidermal tissues (skin, hair, etc.).

The fact that a progressive hepatitis does occur after the action of poisons on the liver was well shown by two cases of tetrachlorethane poisoning which I investigated. In these, many weeks after the occurrence of toxic jaundice, symptoms of portal obstruction, such as ascites, developed. Similar results have been observed in the effects of alcohol. Thus a chronic drinker may develop ascites months after he has become a total abstainer.

Protection of the Liver against Poisons

It is now well recognized that the presence of glycogen in the liver cells affords marked protection against toxic substances. The administration of glucose—about two ounces, for instance, by the mouth—is a most valuable protection if given before any toxic substance is administered, whether it is trinitrobenzol compound, chloroform is an anæsthetic or any of the numerous toxic substances—antimony or bismuth compounds, etc.—so commonly used to-day in the treatment of disease.

Catarrhal Jaundice

Dr. Spence has pointed out that in catarrhal jaundice there is for a few days definite evidence of impairment of hepatic function as shown by the lævulose test. I have myself confirmed this in cases of catarrhal jaundice under my care at St. Mary's Hospital. I have no doubt that catarrhal jaundice" as seen in peace time is exactly the same condition as the epidemic catarrhal jaundice" which occurred during the war, and which was described by me in the *Lancet* in 1916 and in the Lettsomian Lectures in 1919. The enlargement of the liver and spleen occurs in both of the conditions and the symptoms are identical. *The jaundice is due to pathological changes in the liver itself, probably arising from a bacterial infection.* The degeneration of the liver cells in catarrhal jaundice may, as in some cases recorded by me, be of such severity as to cause death from autointoxication and atrophy of the liver, this only occurred in about 0·4 per cent. of the cases of epidemic catarrhal jaundice" seen in Mesopotamia in 1917. It would be expected that if catarrhal jaundice is hepatic in type it would show a definite *impairment of hepatic function* and Dr. Spence's confirmation of this is of great value.

The differential diagnosis between catarrhal jaundice and arsenobenzol jaundice can however be clearly made. In arsenobenzol jaundice there is a history of the administration of the drug, splenic enlargement is absent and the enlargement of the liver is not always so uniform as it is in catarrhal jaundice—thus the *right lobe may* be relatively more enlarged than the left in salvarsan jaundice. In both kinds of jaundice *the liver diminishes in size* considerably during the continuance of the jaundice, but *the diminution* is usually more marked in arsenobenzol jaundice. In it the lævulose test for impaired hepatic function remains positive for a longer period while in catarrhal jaundice Dr. Spence has found that the test only remains positive for about three days. The differentiation is absolutely established by the presence of arsenic *in the* urine, the hair, and the nails, in the case of arsenobenzol jaundice. It is important that in the analysis a reliable *method for the detection of arsenic* should be employed, such as the electrolytic Marsh Berzelius test the organic matter being destroyed by treatment with arsenic free sulphuric and nitric acids.

I believe that the view of "catarrhal jaundice" adopted by the French school is correct—namely, that catarrhal jaundice is a hepatic or liver cell degeneration set up by an intestinal infection, the toxins being bacterial in origin.

GENERAL DISCUSSION

The Chairman (Dr. Langlon Brown, Vice President) said that the Section had heard three valuable papers on an interesting chapter in pigment metabolism. *The old* conception of haematogenous jaundice, so long dethroned, was returning in the new guise of *haemolytic jaundice. It* seemed to him that Dr. McNee's classification and Professor van den Bergh's *results could be* compared thus:

Type of Jaundice.	Van den Bergh Reaction
1 Obstructive	Direct
2 *Toxic and infective*	Biphasic
3 Haemolytic	Indirect

One thing had come out clearly—the correctness of the French view that catarrhal jaundice was not due to obstruction of the ducts by mucus but to hepatitis. He instanced cases of catarrhal jaundice in which the van den

Bergh reaction was mainly indirect, while hepatic insufficiency was proved by the laevulose and lipase tests Glucose appeared to be beneficial in these cases Dr McNee's work explained why splenic anaemia might arise from different diseases of the spleen, and why it might go on to Banti's disease Anything which would sufficiently stimulate the haemolytic activities of the reticulo-endothelial system could cause this anaemia, and the spread of the process into the Kupffer cells of the liver, which were part of the same system, was easily comprehensible The new work on latent jaundice threw new light on obscure problems and emphasized again the importance of the threshold of the kidney, which imposed a barrier on the excretion of substances that could be useful to the body Both in cirrhosis and in acholuric jaundice, although the blood might contain bilirubin, there was not sufficient to exceed the kidney threshold, so that it did not escape into the urine

DR H L TIDY (London) referred to the difference in the incidence of jaundice in acholuric jaundice and pernicious anaemia It was generally agreed that both were due to the persistent destruction of red cells in the body Yet in acholuric jaundice the jaundice was common, while in pernicious anaemia any distinct degree was rare He asked if the van den Bergh reaction brought to light any difference between splenic anaemia in adults and the later stages of Banti's disease in childhood, or in the type seen in Egypt He was uncertain about the interpretation of van den Bergh's reaction in certain acute conditions Cases occurred in which it was difficult clinically to make a diagnosis between catarrhal jaundice and gall stones, when he had been in doubt clinically he had also been in doubt with the van den Bergh reaction He asked if others had found a similar difficulty.

SIR BERKELEY MOYNIHAN expressed the view that Banti's disease was merely the termination of a great many conditions of diverse origin, cases of splenic anaemia which he had operated upon had exhibited a great variety of splenic lesions Acholuric jaundice was characterized by the fragility of the red cells, and the fragility persisted after splenectomy He desired to express on behalf of the Section the immense debt they owed to Dr McNee and to Professor van den Bergh for their work on this subject, and he ended with a plea that something might be done by the leaders, both in medicine and surgery, to get the two halves of the profession a little closer together, pointing out that the surgeon was the most formidable weapon of inquiry ever placed in the hands of the physician

DR ROBERT PLATT (Sheffield) pointed out that the fact that the amount of bilirubin in the splenic vein was greater than that in the splenic artery was evidence of the elaboration of bilirubin by the spleen Also there were two methods by which haemolysis might be produced (1) by lowering the osmotic pressure of the fluid in which the cells circulated, (2) by haemolytic agents, such as saponin, which probably acted upon the cell membrane In Bayliss's *Physiology* there was a list of animals arranged according to the fragility of their red cells to low osmotic pressures The list arranged according to fragility to saponin was the exact opposite Now, in acholuric jaundice it was extremely unlikely that the haemolysis was due to a lowered osmotic pressure of the serum, and much more probable that a toxic agent of the other type was at work It was therefore possible that the cells of these people actually developed an *increased resistance* to haemolysis The speaker was undertaking some experiments on these lines, but had not yet reached any conclusions on the subject He also asked how Professor van den Bergh was able to estimate the minute quantities of bilirubin present in normal serum, and the [illegible] haemolytic jaundice with an indirect van den [illegible] reaction always accompanied by increased output of bilirubin in the [illegible]

MR R H PARAMORE [illegible] (Rugby) referred to the blood flow [illegible] with the rise of jaundice through the hepatic capillaries. He would consider the capillary blood flow in the explanation of pathological processes, though Sir James Mackenzie, in a recent letter to the BRITISH MEDICAL JOURNAL,[1] had stated the importance he attached to The point was raised especially in connexion with the so-called toxic or infective hepatic jaundice [illegible] was associated with the degeneration or necrosis of certain cells of the hepatic lobule The central cells were most often affected, those at the periphery escaped Sir Humphry Rolleston, in his paper read before the Section in 1922,[2] had explained the escape of the peripheral cells by supposing that the reputed poison in the portal blood was "prone to be swept on by the arterial blood" to the central cells This was supported by the statement that in streptococcal infection the central cells were also most affected Against it was the statement of Sir William Willcox, made at the 1922 discussion,[3] that "In no cases of delayed arsenobenzol jaundice have amounts of arsenic been found in the liver which could at that time have been causing harm to the liver" Thus opposed the view that the lesions of the central cells of the hepatic lobule were due to the direct action of a poison So did the structure of the hepatic lobule itself The capillaries at the periphery converged on the central vein, and in their progress linked up with each other, the capillary bed narrowing, thus the rate of flow of blood through the capillaries became more rapid as the central vein was reached Thus, if a poison in the blood acted directly on the hepatic cells, we should expect that, in the majority of cases of so-called toxic and infective jaundice, the peripheral rather than the central cells should be first and most disturbed

The speaker was interested in this variety of jaundice because it occasionally occurred in the so-called toxaemias of pregnancy thus it occurred in the pernicious vomiting of pregnancy, which at times led on to the acute yellow atrophy In the *Lancet* of 1922 (vol i) the cause of pernicious vomiting was discussed Two individuals in this country besides the speaker believed that the resulting toxaemic state was caused mechanically, and in his contribution to the discussion[4] the speaker had pointed out how vomiting, by raising suddenly the pressure in the hepatic veins, caused an accession of pressure to appear in the intrahepatic venules, which necessarily impinged on the central cells As the area of capillary bed in the hepatic lobule increased towards the periphery, the effect of this impaction was dissipated as the periphery was reached In support of this idea, he referred to the rarity of jaundice in chronic valvular disease of the heart It was stated by physicians that jaundice in these cases occasionally occurred Fagge and Pye-Smith, more than thirty years ago, had attributed this jaundice to the effect of the back pressure from the right auricle on the hepatic veins—which caused a distension of the hepatic capillaries, and Osler had stated that in hepatic involvement from back pressure in chronic heart cases the central cells of the lobules became atrophied The central cells in this case, just as in pernicious vomiting, felt first and most the effect of the venous impactions In such cases, the jaundice could only be ascribed to an occlusion by compression of the small bile ducts or canaliculi in the periphery of the hepatic lobule by the pressure of the distended adjacent capillaries It was obvious that in individuals with an abdominal tumour, such as the pregnant uterus, frequent impactions appearing at the centre of the lobule could more readily produce similar results

REPLIES

DR J W MCNEE, in replying to the discussion, said he wished to emphasize the fact that what he had described was a theory of jaundice, which agreed with many facts and enabled a rational classification of cases to be made Actual proof of some points was lacking, chiefly because of the difficulty in applying the results of animal experiments to what might happen in man He agreed with Sir William Willcox that the best proof of the occurrence of true haemolytic jaundice was the clinical evidence but hoped that complete experimental evidence would soon be obtained He was glad that everyone seemed now agreed on the mechanism of catarrhal jaundice, which undoubtedly

[illegible]
1 [illegible]
2 [illegible]
3 [illegible]
4 [illegible]

depended on a hepatitis and cholangitis In reply to Dr Tidy, he said that it was true that in the cases of jaundice in which the etiology was most doubtful clinically, the van den Bergh reaction often gave no aid in diagnosis This was because the toxic and infective group of icterus was by far the largest, and in this group the whole range of results of the van den Bergh test might appear at different stages of the one illness He was, of course, much interested in what Sir Berkeley Moynihan and Dr Langdon Brown had said about the help afforded by the new theory of jaundice in the rational explanation of Banti's syndrome and its treatment Finally, Dr McNee said he greatly hoped that Professor Hijmans van den Bergh would be able to give some clue to the explanation of the two different forms of bilirubin distinguished by the diazo test It appeared that no one had yet been able to prove what the difference depended on, but it would be of the utmost importance to do so He asked if Professor van den Bergh could deal with this point in his reply

Professor VAN DEN BERGH said that he had not much to say in reply, because Dr McNee had so well expressed his thoughts He thought they agreed almost completely, but he could not explain their difference with regard to the bilirubin content in the splenic artery and splenic vein Dr McNee did not find any difference, whereas he found, not always, but in the majority of cases of pernicious anaemia and haemolytic jaundice which were splenectomized, and also at necropsy, a difference, and he thought that a mistake in the reaction was hardly possible Naegeli and others—Kazmelson, for instance—had confirmed his observations on this point One speaker had asked why no reaction was found in normal persons in England They also had rarely found so faint a reaction that it was impossible to get a colorimetric reading, but in the majority of normal people it could easily be estimated He could not tell the reason for the difference, he did not think it could be due to any small technical modification, but possibly there was a real difference between the serum content in the two countries As regards catarrhal jaundice it was a curious fact that, contrary to what was the case in England and Germany, cases of this disease in Holland—at least in his clinic—were very rare, so that he had had little experience of it Dr McNee had asked for information about the two kinds of bilirubin distinguished by the diazo test He must confess he had not succeeded in explaining this phenomenon It was not known at the moment whether the difference was due to a very minute difference in chemical structure, or to a loose combination, or to physico-chemical differences in the plasma Dr Platt spoke of urobilin He (the speaker) agreed with Dr McNee that there was at present insufficient information about the formation and production of urobilin, and that further evidence must be sought on this point In speaking of new conceptions of jaundice one must not forget the work of Gilbert and his school who were the first to endeavour to estimate quantitatively the bilirubin in the blood also Troisier, whose work he had already referred to Finally, he wished to thank the Section for its kind approval of what he had said He thought he did not deserve so much, and wondered whether he had *not* increased the confusion concerning jaundice instead of clearing it up He thought that Dr McNee's conception of the mechanism of jaundice gave a better insight into the whole subject, and enabled one to classify cases in a rational way

THE CLINICAL FEATURES OF ANTHRAX

BY

F W EURICH, M D,

Professor of Forensic Medicine University of Leeds Honorary Physician Bradford Royal Infirmary

AFTER a brief reference to the work of the late Dr J H Bell of Bradford Dr Eurich summarized the clinical symptoms of pulmonary anthrax ("woolsorters' disease"), pointing out that an unusual constellation of symptoms, such as vomiting and joint pains, might arouse suspicion, but that they knew at present no test—unless it were the estimation of the opsonic index—which would ensure early recognition of the disease Unfortunately an opportunity of applying the test was rarely given, as medical aid, when sought at all, was mostly sought too late In gastro-intestinal anthrax the bacilli were occasionally found only in blood stained vomit

Turning to the diagnosis of cutaneous anthrax Dr Eurich combated the statement that the impression of cutaneous anthrax upon the observer was indelible and that the appearances were typical If the practitioner waited until the characters had become well marked the disease would then have passed the stage in which treatment was most successful It was unfair, both to the patient and to the practitioner to picture cutaneous anthrax as it is in textbooks and atlases now in general use Even in the very early stages in which the "pustule" was nothing more than a patch of erythema resembling a flea bite or perhaps a trifle larger, with a minute vesicle on top, the disease could be recognized with the help of the microscope, provided the examination of the material taken were made promptly Nor, Dr Eurich said, was the appearance of the *fully* developed "pustule" characteristic it was simulated by vaccinia and sometimes by infection of the skin with *Diplococcus pneumoniæ* Dr Eurich held that the "pustule" should be excised only when in the flea bite stage, or a little later The treatment should otherwise consist in rest to the part affected (splints, bandages etc) the application of disinfectant dressings and the injection of anti-anthrax serum (in Bradford Sclavo's serum had been used almost exclusively), and if this should fail or be not obtainable, Ehrlich-Hata and allied products The latter should be especially useful in the tropics Dr W Mitchell *and the reader of this paper* had in turn been briefed by Bradford firms dealing with dangerous wools and hair to examine all suspicious cases The result had been exceptionally early recognition of the disease and a consequent reduction of mortality from 16 to 5 per cent

DISCUSSION

Dr MITCHELL (Bradford) congratulated the Section on having heard the able paper by Dr Eurich Few people outside Bradford knew *anything of the many years of* arduous toil spent by Dr Eurich in the investigation of the sources and prevention of anthrax He (Dr Eurich) had examined many thousands of specimens of wool and hair such as came to Bradford, and had been able to show that wools not previously scheduled as "*dangerous*" were almost as dangerous as any of those so scheduled He had carried on a long and exhaustive series of experiments to find a mode of disinfecting dangerous wool without detriment to their commercial value, and to Dr Eurich more than to anyone else was due the *international steps taken to guard* the lives of the workmen by the institution of sterilizing stations which rendered the wool and hair innocuous at the port of entry to this country So far Dr Eurich had received little or no recognition for this most valuable work, but presumably he *would receive it in the British way*—some years after he was dead

Dr Eurich in his paper had covered the ground so thoroughly that little was left for anyone else to say There was little or no difficulty in diagnosing cutaneous anthrax in its early stages by *anyone examining a patient ad hoc*, a smear on a slide, a stain and a microscope, and it could be done in a few minutes It required no experience, no particular acumen or ability, only opportunity, and if the average practitioner did not recognize it as early as he might it was simply because in the early stage it much resembled an ordinary pimple and he never thought of anthrax If he did so think he could diagnose it as well as anyone else, provided he made a microscopic examination There were no pathogenic organisms in the living subject *likely to be mistaken for the anthrax bacillus* In internal anthrax the diagnosis was much more difficult, and frequently impossible till too late The symptoms were often far from being alarming in the early stages, and even when the patient was suffering from a profound toxaemia he *often felt tolerably well* Dr Mitchell said that he had known of a man dropping down dead when dressing in the morning to go to work Methods such as the *opsonic* index were, he was afraid, too slow

DR ARNOLD RENSHAW (Manchester) desired to suggest to Dr Ehrlich the use of one of the triphenylmethane dyes—auramine—for use in some anthrax cases He and his colleague, Mr Fairbrother, had examined the antiseptic action of a large number of dyestuffs on bacteria, including *B anthracis* Auramine, in a dilution of 1 in 5,000, had prevented the growth and rendered sterile even spore cultures of this organism when inoculated into dye-broth tubes containing this antiseptic

He did not agree with Dr Mitchell in stating that *B anthracis* was the only organism of the kind found in the tissues of man Recently he had seen a patient with a necrotic wound which refused to heal in which was found a similar Gram-positive central spore-forming bacillus resembling anthrax culturally The patient had intervened in a dog fight, and it was uncertain whether a wound in his leg had been caused by a dog bite or by the end of his stick which was broken during the fight Numerous anthrax-like bacilli were found on examination in a deep sinus in the calf of the leg, which had persisted for about a fortnight A similar organism was found upon the hollow ferrule of a walking-stick, and as the lawn had been freshly manured that morning it was obvious that an organism of the Mycoides group was present, and that the wound had been caused by the stick and received soil contamination The wound was packed with auramine solution, the bacilli speedily disappeared, and the wound commenced to clean up and heal Dr Renshaw suggested that auramine could be used instead of formalin to inject into or around the pustule, or to swab the cut surface of the wound after excision of the pustule to destroy any remaining bacilli Auramine was not caustic or irritant to the tissues in the strengths used, and he had given it intravenously to obtain a concentration in the blood stream of 1 in 20,000 In view of the 100 per cent mortality in cases of pulmonary anthrax, he suggested that it might be worth while trying auramine intravenously, although its action against bacteria (but not protozoa) was probably limited to 1 in 10,000

DOMESTIC ESTIMATION OF URINARY SUGAR

A METHOD WHEREBY THE DIABETIC PATIENT CAN MEASURE THE DAILY VARIATIONS IN EXCRETION OF SUGAR

BY

F C EVE, M D, F R C P,

Senior Physician, Royal Infirmary and Victoria Hospital for Children, Hull

For the guidance of a doctor who is treating a diabetic in his own home the minimum requirement is a knowledge of the excretion of sugar and how it varies from day to day This is necessary for treatment by dieting, it is indispensable if insulin is employed

The following method, though rough and ready, is one which I have been using for the last four years, and I have found it adequate and reliable Perfect methods are impracticable in the home except very occasionally What the doctor needs to guide treatment is a long and continuous daily record

METHOD

Apparatus Required—(1) Urinometer, reading 1000 to 1040, in a packable form (2) Yeast, fresh every few days, costing a penny (3) Thermos flask (one pint) (4) An engineering students' book of squared paper (2d) Every night at bedtime the patient washes out the thermos flask with very hot water, and then passes his water into it He adds a lump of yeast about the size of a hazel-nut, gives the mixture a good shake, and corks with cotton-wool In a few hours, less than twelve, at blood heat any sugar present will have been destroyed by the growing yeast, chiefly by oxidation into carbonic acid The specific gravity of the urine after fermentation will be reduced to an extent proportional to the amount of sugar originally present This is what we require to know The method is as old as brewing

Charting—The squared copybook is graduated from 1000 to 1040 in its left-hand margin Every half-inch of the upper margin represents a day, and is numbered with the day of the month Every night at bedtime the specific gravity of the warm, freshly passed urine (say 1040) is charted with a black dot, next morning the specific gravity of this *same* warm specimen is again measured, and perhaps has now decreased to 1018 owing to the destruction of the sugar A red dot is placed at 1018 vertically below the black 1040 dot Next day another pair of dots will be placed in the next vertical column, and thus two curves will be spun out which may be connected by a thin line, as in a temperature chart The black curve will show the daily variations of the specific gravity of the urine, and the red curve will show the daily specific gravities after the contained sugar has been destroyed The object is, by diet and insulin, to make the space between the two curves as small as possible For obviously, if the urine never contains sugar, there will be no space between the two curves—that is, they will be superposed

Director, Rowett Research Institute Aberdeen

THE IMPORTANCE OF THE MINERAL ELEMENTS IN THE MAINTENANCE OF HEALTH

THAT the nature of the diet has an influence on health has been recognized since the earliest times The old literature contains much sound and suggestive information which shows that our predecessors were neither so unobservant nor so ill informed as some modern writers would have us believe In recent years, however, the elucidation of the fundamental principles of nutrition and the improvement of experimental technique have made possible a more thorough and systematic study of this branch of medicine The information now being obtained enables us to see more clearly the relationship between dietary deficiencies and resulting diseases, and to realize more fully the importance of diet in the preservation of health The results of modern work show that a faulty diet is not only the direct cause of many diseases, but is also a potent predisposing cause of certain infectious diseases Though much is still obscure, there is now sufficient knowledge, and, what is of almost equal importance, sufficient interest, to make dietetics an important factor in preventive medicine

Until a few years ago interest in dietetics centred chiefly in the requirements of the body for energy and protein, and in the supply of them in the food It was usually assumed, at least by writers of textbooks, that any ordinary diet which supplied sufficient energy and protein would afford complete nourishment for the body, including the provision of all the essential inorganic constituents Such an assumption would be generally justified if the diet consisted of foodstuffs in their natural condition Unfortunately, the highly refined foodstuffs of modern civilization are so ill balanced with regard to several essential constituents that a diet composed chiefly of these foodstuffs is liable to be deficient in several respects, even though it yields sufficient energy and provides the necessary protein During the past two or three years there has been a tendency to regard the evil effects of a too exclusive use of certain of these foodstuffs as due, chiefly or entirely, to a deficiency of "vitamins" Recent work, however, has shown that many of the evil effects may be attributed to a lack of correspondence between the mineral content of the diet and the mineral requirements of the body It is now being recognized that the amounts and proportions of the inorganic elements in the diet are of fundamental importance to the maintenance of health The present paper is confined to a consideration of this aspect of the relationship of diet to disease

The Role of Minerals in Nutrition

The fact that the great bulk of the mineral elements in the body is contained in the rigid skeletal structures is apt to give the impression that these so-called inorganic elements play a less important part in the metabolic processes than the organic compounds As a matter of fact, however, mineral elements are present as essential constituents of all the soft tissues of the body Cell life is impossible without them They control, directly or indirectly, all the metabolic processes, and the ultimate problems of physiology are concerned with their chemical and physical reactions

The interesting experiments of Jacques Loeb and others have shown that not only must these elements be present in the soft tissue and fluids of the body, but that, if the normal functioning of the various organs is to be maintained, they must be present in very definite proportions to form a "physiologically balanced" solution Various mechanisms in the body are concerned in preserving this physiological balance, and are normally efficient in doing so, in spite of the irregular supply presented in the food But when the deficiencies or excesses in the diet are greater than these regulating mechanisms can deal with the physiological balance is upset, and the resulting disordered functions of the cells make themselves manifest as disease

Of the fifteen chemical elements which enter into the composition of the body and are recognized as being essential ten are mineral elements, and each of these ten is known to perform functions which cannot be adequately performed by any of the others As all these minerals are continually being lost from the body in the excretions, and all are required as constructive material in growth, it is obvious that the mineral content of the diet is of primary importance for the physiological well being of the body

Mineral Requirements

The amount of any mineral which must be present in the diet depends upon a number of factors which influence either its absorption or its excretion In estimating the mineral requirements these factors must be taken into account Some which are of practical importance are considered here

The mineral may be present in a combination from which it cannot be easily dissociated in the alimentary canal The diet, therefore might contain a sufficient amount, as determined by chemical analysis, but, owing to the difficulty of assimilation, only a very small proportion might pass through the wall of the intestine into the *metabolic field where it could be utilized In the case of* most minerals both absorption from the intestine and excretion by the kidney are influenced by the amounts of other minerals present Bunge[1] showed that the addition of potassium salts to the diet caused an increased excretion of sodium salts in the urine The results of some recent work by Dr Richards, which will be published shortly, indicate that the potassium sodium ratio in the diet is a factor in determining the percentage of ingested calcium and phosphorus which can be assimilated and retained by the growing animal These results confirm the conclusion reached by Zander[2] and others over forty years ago

Hart and Steenbock[3] have shown that excess of magnesium interferes with the utilization of calcium Phosphorus and calcium are mutually dependent upon each other for utilization So also to some extent, are calcium and iron The balance of the base and the acid radicles affects both absorption and excretion These examples of the interdependence of the different mineral elements in assimilation show that the ratios of the mineral constituents of the diet to each other are of as much importance as the absolute amounts

The nature of the organic part of the diet affects the absorption of minerals from the intestine In the case of some diets oil increases the assimilation and retention of calcium and phosphorus The remarkable efficacy of cod-liver oil in this respect is well known On the other hand, excess of oil, under certain conditions, decreases the amount of calcium absorbed from the intestine

All these dietary factors play a part in determining what proportion of each of the minerals in the diet can be assimilated Their importance is well shown by the results of the experiments by Blauberg[4] He found that in infants the percentage assimilation of the mineral of human milk (whole cow's milk diluted cow's milk and an artificial food, was respectively 81 82, 60 70 53 72, and 32 55 The high percentage of assimilation of the mineral constituents of human milk by the infant is due to the fact that the ratios of the minerals to each other, and the balance of all the constituents of the milk are exactly suited to the requirements of the infant It a calf had been used as the experimental animal the percentage assimilation would have been higher on cow's milk than on human milk The high percentage of assimilation of the minerals of milk (60 70) as compared with the artificial food (32 55) is of practical interest Sherman and Hawley have recently brought forward confirmatory evidence of the superiority of milk as a supply of mineral matter

Certain factors not connected with the diet may influence the absorption and retention of minerals The results of the work of the Glasgow school on rickets indicate that good hygienic conditions and exercise favourably influence the retention of calcium and phosphorus in children Recently the influence of the ultra-violet rays has received much attention In some recent experiments carried out at the Rowett Research Institute, Dr Henderson has found that one of the ultimate effects of the ultra-violet rays on a young pig receiving a diet ill balanced with regard to its mineral content is to reduce the excretion of calcium in the faeces and to increase the excretion in the urine The net result is a gain in the *rate of storage of the mineral*

All these factors which affect the absorption and excretion of minerals must be taken *into account in estimating* the amount of any given mineral that must be present in the diet to meet the requirements of the body The problem is not so much to ensure that a definite amount of any given mineral, as determined by chemical analysis, shall be present in the food, as to ensure that the whole diet and attendant conditions are of such a nature that all the essential minerals will be absorbed from the intestine in the amounts and proportions required to maintain the proper physiological balance of the fluids of the body It is impossible, therefore, to make any unqualified statement as to the absolute amount of any mineral which must be present in the diet to meet the requirements of the body The amount required is relative to a multiplicity of conditions

As a guide in dietetics estimates have been made of the requirements of calcium, phosphorus and iron the three mineral constituents believed to be most frequently deficient in the diet Albu and Neuberg,[5] after a review of the literature, came to the conclusion that the diet of an adult should contain 1 to 1 5 grams of CaO— that is, roughly 0 7 to 1 1 grams of calcium a day The more recent estimate of Sherman[6] gives practically the same amount—namely, 1 gram a day The phosphorus requirement is estimated by Forbes,[7] after a consideration of all the available experimental data, at about 1 5 to 1 75 grams of phosphorus (3 4 to 4 grams P_2O_5) a day Estimates of the requirements of iron vary from 60 mg (Albu and Neuberg) to 10 mg (Sherman) a day

In proportion to their weight children require more than adults, owing to their need for constructive material for growth A calculation based on the percentage composition of the body and the average rate of growth shows that a child must store nearly a third of a gram of calcium a day The results of balance experiments, in which the amount retained is found by determining the intake in the food and the output in the excreta, correspond with such a calculation Herbst[8] found by balance experiments that boys between 6 and 14 years of age store 0 2 to 0 4 gram a day

According to Sherman the diet of children should contain 0 23 gram of calcium, 0 43 gram of phosphorus and 0 005 gram of iron for every 1,000 calories These figures are to be taken as minimal quantities for it was found that to get the maximum storage of calcium the food had to

contain three times the amount stored One gram a day, therefore, may be taken as the amount of calcium which should be present in the diet of children

The acid base balance is of more importance in children than in adults A positive base balance of 10 c cm of a decinormal base per kilo per day is required during growth (Shohl[10])

The Supply of Minerals in the Diet

The following table gives an idea of the mineral content of some commonly used foodstuffs As the energy requirement of the body determines the quantity of food eaten, it is convenient to state the amounts of the various minerals contained in the quantity of food required to yield a given number of calories Human milk is included in the table for the purpose of comparison It is in the case of young children that the supply of minerals is of greatest practical importance, and human milk may be taken as representing the ideal standard for them

TABLE I

	Mineral Content per 1 000 Calories						C cm Normal Solution per 1 000 Calories	
	Ca	Mg	K	Na	P	Fe	Excess Acid	Excess Base
Human milk	0 53	0 08	0 77	0 16	0 23	0 011		26 90
Cow's milk	1 74	0 17	2 07	0 74	1 35	0 003		22 75
Wheat	0 13	0 37	1 32	0 11	1 18	0 014	37 08	
Wheat flour	0 06	0 05	0 32	0 17	0 26	0 003	31 43	
Wheat bran	0 38	1 59	3 96	0 60	3 33	0 023	3 74	
Polished rice	0 03	0 10	0 20	0 07	0 28	0 003	26 62	
Maize	0 03	0 30	0 95	0 07	0 73	0 008	25 36	
Cornflour	0 002	0 02	0 07	0 005	0 05	0 001	1 81	
Sugar	—	—	—	—	—	—		
Meat	0 07	0 14	1 97	0 49	1 25	0 017	85 38	
Potatoes	0 17	0 34	5 15	0 25	0 70	0 015		98 75
Cabbage	1 43	0 48	7 83	0 86	0 92	0 032		138 26
Spinach	2 79	1 53	32 28	5 21	2 84	0 150		999 13
Orange	0 88	0 23	3 45	0 23	0 41	0 004		118 77
Egg yolk	3 59	0 42	3 01	1 97	13 73	0 236	888 19	

In general, the carbohydrate-rich foodstuffs—for example, flour, rice, cornflour, and sugar—are poor in mineral matter Most have less than 0 1 gram of calcium per 1,000 calories, as compared with the minimum requirement of 0 25 gram, and less than the minimum requirement of iron, 0 005 gram The cereals are rich in phosphorus but poor in calcium They have also a marked excess of acid radicles The refined cereal products—for example, wheat flour—are poor in mineral matter, most of which is removed in the milling Green vegetables are rich in calcium and iron and have an excess of alkali, but they are relatively deficient in sodium The ratios of the minerals to each other in any individual foodstuff are very different from those found in milk In a combination of cereals and green leaf the ratios approximate more closely to those of milk, but even then there is a shortage of sodium and chlorine The craving for common salt (sodium chloride) on a vegetarian diet is a natural instinct which tends to adjust the mineral balance Of all the foodstuffs cow's milk, as would be expected, approximates most closely to the composition of human milk It has a marked excess of calcium

The dietary of a large part of the population in this country, especially in the cities, consists mainly of cereal products and other carbohydrate-rich foodstuffs, such as potatoes and farinaceous foods, because they are the cheapest sources of energy The most common supplements are meat and butter or margarine The average consumption of milk is only about half a pint per head per day, and in many households green vegetables do not form a regular part of the diet Hence the foods that form the greater part of the diet are those deficient in both calcium and iron It has been estimated that 50 per cent of American dietaries contain less than 0 67 per cent of calcium, which is well below the standard of 1 gram a day In this country the average intake is likely to be even lower, because the average consumption of milk, usually the chief source of calcium in the diet, is twice as high in America as it is in Britain

The mineral content of the diet is of more importance during the period of growth than in adult life The requirements are relatively greater, and the evil effects of deficiencies are more serious During the first six months of life an infant growing at the normal rate should store between 0 2 and 0 3 gram of calcium a day According to Bendix[11] the daily consumption of human milk by the sucking infant during that period is 600 to 1,000 c cm, which contains just about the amount that must be stored Practically the whole of the calcium in the mother's milk must therefore be assimilated and retained It is evident that if the maximum absorption is prevented an absolute shortage will occur Digestive disturbances, with resulting diarrhœa, may hurry the intestinal contents through the alimentary canal before complete absorption has taken place A disturbance of the optimum ratios of the constituents of human milk would, as we have seen, be likely to decrease the percentage assimilation This may occur in supplementary feeding Zander[2] examined the mother's milk in cases where infants on the breast suffered from a form of malnutrition suggesting a shortage of calcium He found that the potassium sodium ratio was much higher than that found in the milk of mothers with healthy infants An abnormally low percentage of calcium in human milk has been suggested as a cause of malnutrition The evidence on the point is, however, not conclusive, although it is known that there are rather wide variations in the percentage of calcium, which may be as low as 0 2 and as high as 0 8 All that can be stated with certainty with regard to the calcium content of human milk is that the amount present in normal milk represents the minimum requirement, and any interference with its complete utilization will result in a shortage There is need for further investigation on the subject of the variation in the percentage composition of the ash of human milk It is probable that an abnormal mineral content of the milk may be the cause of some of the cases of malnutrition occurring in breast-fed infants

Compared with human milk, cow's milk contains rather more than three times the amount of calcium per 1,000 calories, but the utilization is less complete To get the maximum storage the amount of milk taken must contain about three times the amount stored There is, therefore, not such a marked surplus of calcium in cow's milk as might appear from an examination of its chemical composition

In the heating of milk insoluble tricalcium phosphate is formed out of the dissolved phosphorus and calcium salts This is well known in the dairy industry In cheese making the curd does not form as easily with heated milk as with fresh milk The difficulty is got over by adding a soluble lime salt In some experiments at present being carried out by Mr Crichton and the author we find that calves fed on pasteurized milk are liable to suffer from malnutrition But pasteurized milk *plus* either a generous supply of orange juice, or of a soluble lime salt, gives as good results as fresh milk It seems probable that the changes in the combinations produced by the process of heating interferes with the maximum calcium assimilation There is, therefore, a greater danger of calcium shortage with pasteurized milk than with fresh milk

The dilution of the mineral content of cow's milk by the addition of carbohydrates results in a diminished intake of minerals in proportion to the energy-yielding constituents Corry Mann[12] has pointed out that rickets, a disease in which there is failure to assimilate and retain sufficient calcium, is induced by the use of sweetened condensed milk He attributes the evil to the presence of an excessive amount of carbohydrates It is more probably due to deficiency of minerals An amount of sweetened milk, of which he gives an analysis, provides only half of the mineral matter contained in an amount of whole milk of equal calorie value

In the period immediately following weaning there is a danger of calcium deficiency unless the diet consists

almost exclusively of whole fresh cow's milk Unfortunately, at this period it is customary to introduce into the dietary of the child refined cereal products and other carbohydrate-rich foodstuffs Not only is the mineral content of these low, but the percentage utilization of what is present is also low This is the stage in the child's life at which there is the greatest danger of mineral deficiencies

As has been indicated above the minimum iron requirement of children has been estimated at 0 005 gram per 1,000 calories Milk—either cow's milk or human—does not contain more than 0 0035 gram, and the amount appears to be variable, depending on the nature of the diet of the mother According to the analyses of Hess and Unger[13] the milk of stall fed cows contains only about half as much iron as the milk of cows on pasture The child is born with a reserve store of iron sufficient to carry it over the first few months, during which milk is its sole food, but on prolonged feeding with milk unaccompanied by an iron-rich food, there would appear to be a danger of a primary anaemia The refined cereals make no significant contribution to the iron of the diet Many of them contain even less iron per 1 000 calories than milk

The acid base balance is of more importance in children than in adults Milk provides the necessary positive base balance Cereals however, have an excess of acid radicles over bases There is a danger of excessive acidity at weaning unless the diet be supplemented by fruit and vegetable juices which have a marked positive base balance

From the above considerations it appears evident that where refined cereal products form a large part of the dietary there is a real danger of a deficiency of certain minerals unless the diet be supplemented with a generous supply of milk green vegetables, and fruit The danger is greatest in the case of infants and young children, because their requirements are relatively greater and their diet is liable to be less varied It seems probable that the most common defects are shortage of calcium and iron, and an excess of acid over basic radicles

It has been suggested that deficiencies of some of the minerals required in small amounts may be of frequent occurrence On this point however there is very little reliable evidence The one which has attracted most attention is iodine but the amount required, and the amounts present in foodstuffs, are so small that it is difficult to determine by direct experiment whether the commonly used foodstuffs contain sufficient In many foodstuffs the presence of iodine cannot be detected (Forbes[14]) The only foods that yield an appreciable amount are green vegetables and marine products

THE INFLUENCE OF MINERAL DEFECTS IN CAUSING DISEASE

Adults

There is abundant clinical evidence, supported by experimental data, to prove that mineral defects in the ration can cause serious diseases in full grown animals Hay containing an excess of potassium results in malnutrition in cattle and horses (Zuntz[15]) Excess of phosphorus causes bone disease in horses (Ingle[16]) In South Africa deficiency of phosphorus has been found to be the cause of pica in cattle The same deficiency leads to malnutrition in dairy cows in certain parts of India Deficiency of calcium has been held to be responsible for many forms of malnutrition (Hutyra and Marek[1]) It is therefore possible for the full-grown individual to suffer in health from mineral defects in the diet It has been suggested by various writers—for instance, Loew[18]—that diseases due to this cause are not uncommon in human beings The fact that nursing mothers frequently suffer from deficiency of calcium seems to be well established But statements with regard to diseases held to be due to deficiencies of other minerals are not sufficiently supported by clinical evidence and experimental data to make them more than opinions and conjectures There is, however, sufficient evidence to warrant further investigation on this subject

Children

1 *Calcium*.—The evils of mineral deficiencies are very definite during the period of growth The following table gives an idea of the extent to which development may be arrested owing to shortage of calcium The figures refer to an experiment[19] with two groups of young pigs, which were fed on a ration consisting of cereal products, blood meal and potatoes, supplemented with cod liver oil, swede turnips and yeast extract One group had access to a lime-rich salt mixture

TABLE II.—*Influence of Deficiency of Calcium on Rate of Growth*

	Average Initial Weight	Average Gain in Weight in 14 Days
	Pigs.	Pigs.
Ration only ...	11.6	31.3
Ration plus calcium	11.3	60.9

In addition to slow rate of growth, the animals receiving no salt mixture showed signs of malnutrition after about thirty days on this ration There was lack of lustre in the hair, a dry hard skin, decreased appetite some intestinal disturbance, and lameness There was also a marked increase of nervous excitability By the end of the second month the gross clinical signs of rickets appeared The diagnosis of rickets was confirmed by *post mortem* examination

Many earlier workers have noted that arrested development and rickets frequently occur on a diet deficient in calcium A review of the literature is given by Hutyra and Marek[1] Recently Korenchevsky has noted nervous excitability and intestinal disturbances accompanied by diarrhœa in rats on a calcium deficient diet The experiment referred to shows that these evil effects can occur even though cod liver oil be present in the diet

Calcium starvation, of course, is not the sole etiological factor in rickets, though it is undoubtedly an important one McCollum, Simmonds Shipley, and Park[20] have shown that phosphorus is equally important The deposition of lime salts in the bones seems to be dependent upon the concentration of calcium and phosphorus in the circulating fluids, and the main factor in maintaining the essential physiologically balanced solution in the blood is the mineral content of the diet If the diet is such that all the essential minerals pass through the wall of the intestine in the proper amounts and proportions it is very doubtful if rickets can occur Both cod liver oil and ultra-violet rays have a marked therapeutic action in preventing and curing rickets In both cases the beneficial influence seems to be due to the fact that the loss of calcium in the faeces is decreased Henderson finds that under the influence of the ultra-violet rays excretion by the urine is increased Their influence is most marked in cases where the mineral content of the diet is defective It seems probable that these therapeutic agents increase the percentage absorption of the deficient calcium though, owing to the uncertainty as to the extent to which calcium is excreted by the intestine, it is difficult to obtain direct evidence on this point If the diet is otherwise satisfactory, rickets will not occur in the absence of the vitamins of cod liver oil (Zilva and others[21]), and we have brought to maturity from birth, without any sign of malnutrition pigs which have never been under the influence of ultra-violet rays, other than what passed through the glass window of a northern room[19]

The first line of defence against rickets is the adjustment of the mineral content of the diet In imperfect diets cod-liver oil and direct sunlight are very valuable adjuncts In the case of young pigs our experience is that sunlight and exercise are more potent in preventing rickets than cod liver oil

Recent work has called attention to the evil effects on the offspring of calcium deficiency in the diet of the mother (Korenchevsky[11]) In a recent article McCollum[22] says

'Even when the diet contains everything else that is necessary for the normal development of a mammal, but the calcium content falls below the optimum although not to an extent to interfere with growth, the first generation of animals may look fairly normal But will age early Their fertility will be low and infant mortality high and the few young which grow up will exhibit deformities which prevent their reaching the full adult size They are short and stocky, with deformities especially of the ribs and pine The displacement of the viscera downward owing to the contraction of the thorax gives them a pot bellied appearance'

We have seen that calcium deficiency is very liable to occur in infancy and early childhood It is probable that this dietary error may be an important etiological factor in many cases of rickets, intestinal disturbances, nervous excitability, arrested development, and various other diseases which are known to be associated with defective nutrition

2 *Iron*—The effects of an iron deficiency have been studied in pigs by McGowan and Crichton[23] They found that young pigs, whose sole diet was milk from a sow on an iron-deficient ration, suffered from a primary anæmia The haemoglobin was, in some cases, as low as 15 per cent The skin was abnormally pale The animals grew at a normal rate, and were excessively fat, but were little inclined to exercise The mortality was high The condition can be prevented and cured by the administration of inorganic iron to the young pigs The appearance of these anæmic pigs seemed to the writer, who followed the experiments closely, to resemble that of young children who had been kept for a long time on a diet of milk and refined cereal products, which, we have seen, does not supply sufficient iron for growth It is probable, as has been suggested by v Hoslin,[24] that primary anæmia may be not infrequent in children

3 *Iodine*—The possibility of deficiency of iodine is worthy of consideration Ennis Smith[25] found that a high mortality in young pigs in certain districts of the United States could be prevented by feeding small quantities of potassium iodide to the sows They concluded, from chemical analysis of the feeding stuffs, that the malnutrition of the young pigs was due to deficiency of iodine Kelly, who is working at this subject at the Rowett Institute, finds that in marasmic young pigs, fed indoors on a cereal ration, the total amount of iodine in the thyroid is unusually low, in some cases less than half that found in healthy pigs of the same age Whether this signifies deficiency in the diet or is merely a result of the marasmic condition is, however, not yet established In laying hens iodine seems to have an influence on calcium metabolism It may not be without some significance that the seasonal variation in the iodine content of the thyroid as determined in sheep corresponds with the seasonal variation in the incidence of rickets

Balance of Minerals

The evil effects of excess of individual minerals in the diet are due chiefly to their adverse influence either on the absorption or on the excretion of other minerals Reference has already been made to the influence of excess of potassium and magnesium on calcium metabolism Prolonged acidosis causes a loss of minerals from the body, calcium and phosphorus being especially affected[26] The disturbance of mineral metabolism leads to chronic malnutrition The effect of a wrong acid base balance in the diet of young children would seem to be worth keeping in view in studying gastric disturbances of obscure etiology

In considering the practical application of the results of experiments on animals which show the influence of mineral defects in the diet in producing disease, it must be kept in view that it is easier to cure disease which has been experimentally produced under definite and known conditions than to treat successfully diseases with a similar symptomatology but which arise spontaneously There is a danger in drawing too rigid conclusions from laboratory experiments The evidence which has been brought forward is, however, sufficient to warrant the belief that in practice diseases in children due to mineral defects in the diet are comparatively common, and that more attention should be paid by the clinician to the inorganic constituents of the diet, both in the etiology and the therapy of diseases of malnutrition

THE CORRECTION OF MINERAL DEFICIENCIES IN THE DIET

Fortunately mineral deficiencies can be easily corrected by including in the diet foodstuffs the virtues of which are universally recognized Milk, green vegetables, and certain fruits are rich in calcium, milk, egg yolk, and cereals containing sufficient of the embryo and outer part of the grain are rich in phosphorus Green vegetables and egg yolk are rich in iron The only certain sources of iodine are green vegetables and cod-liver oil Fruits and vegetables have an excess of alkali, and thus can correct a diet which is too acid On account of its great wealth of calcium and iron, spinach should be of special value for infants These foodstuffs, which are rich in inorganic constituents liable to be deficient in the modern diet, are also rich in vitamins The author has pointed out elsewhere[27] that in some of the work on vitamins much of the beneficial effect ascribed to hypothetical vitamins is in reality due to the minerals present in the substances given as a source of vitamins These correct the mineral defects in the basal diet In experimental work it has been found by several workers that as the mineral matter of the ration becomes more closely adjusted to the requirements of the body the need for vitamins decreases In practice, therefore, the adjustment of the mineral balance is of more importance than the inclusion in the diet of substances supposed to be rich in vitamins Indeed, in our experiments with pigs, calves, and fowls, we have found that if the diet be properly balanced with regard to minerals there is no likelihood of any deficiency of vitamins occurring This is in agreement with the conclusion reached by McCarrison,[28] who states

"Indeed, if the food be balanced with due regard to the biological value of the proteins, carbohydrates, fats, and salts, it is hardly conceivable that deficiency disease, with the possible exception of scurvy, could arise outside the laboratory In practice, however, it will usually be found that the vitamin content of the food is reduced in proportion to its lack of balance the two factors are intimately correlated"

CONCLUSION

Although in the present paper an attempt has been made to emphasize the importance of the inorganic constituents of the diet for the preservation of health, it is recognized that this is only one aspect of nutrition The diet must be regarded as a whole in relation to all the needs of the body Both the quantity and quality of the protein are important factors, especially in growth Undernutrition due to deficiency of energy-yielding constituents in the food, and overnutrition due to excess, are both factors in producing disease Even the quantity of water ingested is of importance Further factors not connected with the diet—for example, sunlight, exercise, and psychological influences—must be taken into account

The multiplicity of factors in nutrition makes it difficult for the laboratory research worker to assess the practical value of his results Owing to his limited view he is apt to overestimate the importance of the aspect of the subject on which he is working The clinician, on the other hand, is much more likely to give due consideration to all the probable factors, and is better able to see them in their proper perspective In this country, however, the clinician has paid too little attention to the influence of mineral deficiencies in disease If the discussion at this meeting succeeds in creating more interest in the subject, it will have served a useful purpose

II.—JOHN SINCLAIR MANSON, M.D. EDIN., D.P.H. Camb.,
M.O.H. Runcorn Rural District.

COMMON ERRORS OF DIET IN AN URBAN POPULATION.

DURING the war many practitioners must have been struck, as I was myself, by the healthy, well fed, and generally improved appearance of those men home on leave whom they had known previously in civil life. The men had put on weight, they looked in rude and robust health, and, as they themselves expressed it in the colloquialism of the day, "were in the pink", the same phenomenon showed itself during the rapid demobilization after the armistice.

After the lapse of a year, or even less, it was painful to observe a distinct deterioration in their physical condition. Many had lost their ruddy appearance, all had lost weight, and the civil attire acquired on demobilization hung loosely on their figures.

These general observations are corroborated from a perusal of the army documents of men claiming pensions. In many instances records of weight while in the army have been entered, and in the great majority there has been found a loss of one, two, or even more stones at the time of examination. Without going into a detailed comparison of the conditions of active military life (open air, exercise, excitement) with those of civil life (confined space, routine, monotony) one may assume that the most important factor of all in the changed appearance above described has been that of food.

I think it is generally agreed that in no war has the active service man been so well fed as in the great war. The nearness of the base to the main field of operations, the excellence of the transport, and the wisdom of the authorities in putting into practice the old military maxim — that an army fights on its belly — all contributed to this desirable end.

The deterioration to which I have alluded—if it be admitted, as I think it must—requires explanation, and it is of special significance, for it affects adult males, many of them breadwinners. Now if the breadwinners have deteriorated it may be assumed that families also have proportionately deteriorated, or rather have never reached the physical standard of fitness formerly attained by the breadwinner.

At the Leicester meeting of the Association in 1905, in the Section of Industrial Hygiene, Dr. (now Sir) Dawson Williams opened a discussion on "Physical deterioration, its causes and extent." During that discussion much emphasis was laid on underfeeding, especially during childhood. Dr. William Hall of Leeds laid stress on the superiority of Jewish children in Leeds, living under the same or even worse conditions than Gentile children, and attributed that superiority to better feeding. My own observations and inquiries regarding the diet of workers in an industrial town have led me to the conclusion that errors of diet are common and widespread, and not confined to the poorest class, if there be such a class in these days when the unskilled labourer receives nearly as much pay as the skilled worker. My chief observations have been on the midday meal, and I have been struck by the *absence*—except perhaps on Sundays—of those food substances, such as broths or soups, meat, potatoes, vegetables, which should constitute the ingredients of the most substantial meal of the day. Frequently one sees a meal consisting of two or three small slices of bacon, brawn, or corned beef, pickles, bread, butter or margarine, and tea laid out for the breadwinner. For the rest of the family, perhaps female mill workers, there may be a boiled egg, bread, margarine, sweet cakes, and tea.

On other days this meal may consist of fish and chips hastily purchased from a neighbouring shop, in addition to the inevitable *bread, margarine, and tea*. In one district there is a great demand for "savoury duck" at the week-end. This delicacy consists of the lungs, liver, or kidneys of the sheep or pig, boiled and minced with bacon or meat and baked with the omental fat of the pig. This certainly is a nutritious dish, which could be commended by polyglandular therapists. Unfortunately, owing to the prolonged cooking and preparation, the supply is not equal to the demand. On the other meals—breakfast, tea, and supper—I have made few observations, but inquiries reveal an appalling monotony of tea, bread, margarine or butter, sweet cakes, with the addition, perhaps, of a *little* bacon, sausage, or cheese and bacon. Fresh milk is used very sparingly, but tinned milk is to be seen on almost every table.

The amount of tea consumed varies considerably in families, from 3 to 8 ounces of dry tea per head per week, the amount of tea consumed by the nation is 9 pounds per *head per annum*. Night workers have tea prepared in cans with tinned milk and sugar. This is warmed and drunk during the first meal hour. For the second meal, dry tea and sugar are carried for its preparation.

Compared with institutional dietaries the amount of tea consumed is greatly in excess. My own observations and inquiries have led me to the conclusion that the diet is of the industrial worker is deficient in soups, broths, oatmeal porridge, fresh milk, fresh vegetables, peas, lentils, beans, and in fact of any meal that requires careful and prolonged cooking. Further, that the tendency is growing to a more extensive use of what I have heard described as "angel food"—namely, sweet cakes, tea, cheap jellies, tinned apricots or pineapple served with tinned milk, fish and chips, "snippety" tasty meals instead of substantial meals of such variety as to give a well balanced diet.

Dr. Harry Campbell,[1] in the BRITISH MEDICAL JOURNAL of 1905, wrote a series of articles on the diet of the *Precibiculturists—the primitive races of men who neither* cultivated plants nor animal for food—and showed the wide variety of diet provided by "wild" food. For animal protein, man has eaten anything from a louse to the putrid carcass of a whale, *not excluding* man himself, and for vegetable food he has eaten roots, plants, and nuts of immense variety and range. Instinct and necessity forced him to a varied diet with occasional orgies of gluttony on special occasions, as when the stranded carcass of a dead whale offered opportunity to satisfy the instincts for animal protein and fat. This desire or need for animal protein is commented *on by Bates*[2] *in his book The Naturalist on the River Amazon*. Attributing his poor health while on a voyage up the Tapajos to the lack of flesh food, he killed two large sized spider monkeys and smoke-dried the joints. He describes how at the last he kept an arm hung up in his cabin from which he cut slices from time to time until it was consumed. This was his nearest approach to cannibalism. It would seem that primitive man, or civilized man under primitive conditions, made greater efforts to secure the necessary food for adequate sustenance than does the modern industrial worker with his unlimited tea, bread, and margarine.

In past ages religions guided the people in their dietary. The Mosaic laws still hold good for the Jews, Hindu and Moslem have their proscribed foods, and so also with certain sects of Christianity. In these modern days, when the whole world is a food market to a country like ours, it is not enough to leave the choice of foods to the instinctive desires and tastes of the people, science should take up the duty of directing, guiding, and persuading them to adopt suitable dietaries which will maintain them at a standard pitch of health and vigour.

In conclusion, let me quote from an eminent physiologist, Professor E. Cathcart,[3] who, in his presidential address on "The efficiency of man and the factors which influence it" to the British Association at Hull in 1922, said "One of these factors is nutrition. It may be stated definitely that an insufficient intake of food, or the consumption of poor or inadequate food, is one of the chief sources of general inefficiency. Our resistance to the effects of hard and continual work, just as to the effects of an infection, is largely controlled by our reserves. The capacity of the body to store reserve food material which will meet the daily demands for energy and leave a surplus is another of the vital factors of safety. The body is undoubtedly capable of withstanding complete deprivation of food for comparatively long periods, but with a corresponding depression in its capacity to perform external work. Complete starvation is a state which is rare, and does not affect the question at issue. The much more important problem is, unfortunately, too common, the influence of chronic under-nutrition, a condition which lowers efficiency, not

merely in the actual performance of muscular work, but by increased susceptibility to disease This is a question which has never received the attention which its importance demands, largely on account of the immense difficulties of carrying out the investigation in a practical manner" The position to-day is reflected in the reply to a question in Parliament when Mr Stephen Walsh, Secretary for War, said that in the year 1921-22 the percentage of recruits rejected for physical reasons was 56 per cent, and the percentage for the year 1912-13 was 27 per cent The higher percentage of rejection in the later year was no doubt the effect of war conditions upon the physique of the population, but he was glad to say that the quality of the recruits now coming forward was steadily improving [4]

County Medical Officer of Health, Somerset

DIET CONTROL AS AN INSTRUMENT OF PUBLIC HEALTH PROGRESS

PUBLIC health *concerns itself with all influences which* make for a healthier community Knowledge *more and more emphasizes the great importance of nutritional factors in the well-being of the individuals composing any community* Even as regards purely bacterial diseases *it is evident that the nutritional conditions of the individual* play a *significant and important part affecting the extent to which* that individual is able to avoid falling a victim to infection, or if attacked of putting up a better fight *against the bacillus* While *this applies to every* bacterial infection, it is especially noticeable for the more chronic bacterial diseases, of which tuberculosis is at once the most conspicuous and the most important

Apart, therefore, from its applications to the individual, there would seem to be a wide field for a sustained effort to use diet control as an instrument to improve the public health I do not think anyone will quarrel with such a view, while indeed its importance is *now not* underrated, but I would suggest that *the practical application of this view in public health has lagged behind its appreciation*

As regards certain aspects a good deal has been done We have seen in recent years sustained and very successful efforts to improve the nutrition of nursing and expectant mothers and to feed infants on correct lines From my own experience in Somerset it is evident that the judicious exercise of the power to make milk grants to these classes of cases has been very beneficial Wisely used these grants represent, not doles to supplement the family income, but the scientific application of the principles already enunciated Valuable work is also being done to prevent dental caries, with its train of ill effects, by instructions based upon what I consider to be the proved relationship between defective methods of feeding and dental caries The supply of food adequate as regards vitamins and calcium to the expectant mother is also an important step in this direction There is also a tardy and inadequate application of the importance of good nutrition in connexion with tuberculosis prevention, and something is being done, but so far as I can judge of no great extent, to assist in the nutrition of early tuberculosis cases as a weapon of cure

It should, however, be practicable to extend greatly this field of public health Large sections of the people have to exist on an income which is inadequate, or at the best barely adequate, to provide for the normal nutrition of those who have to subsist upon it It is evident that the money available for food should therefore be spent to the best advantage as regards energy in the food purchased, the correct amounts of each kind of food, and proper preparation to make as much of it as possible assimilable We must all admit that these desirable conditions are not fulfilled and that present-day dietary habits are capable of material improvement

I do not propose to advance arguments to support this view since to do so seems unnecessary A number of scientific investigations bear it out, one of the most valuable being the "Study of the Diet of the Labouring Classes in the City of Glasgow," published in 1913, and carried out by Miss D E Lindsay, B Sc, in connexion with Professor Noel Paton The concluding remarks in this report are still, I *believe, applicable*

> 'These figures show that in the United Kingdom among the labouring classes, urban and rural, the wages are frequently so low that, after providing the barest necessities of life, little or nothing is left for amusements, travel, or other amenities It is to be feared that in the face of old established dietary habits, of ignorance, and of the stultifying influence of the surrounding, any reform in the mode of feeding which might set free a greater proportion of the income will only be slowly achieved as the result of proper teaching and training in the schools'

As Professor Paton puts it, these studies "show that ignorance and bad marketing as well as penury play their part," while he adds, in regard to certain diets found "they encourage the hope that the teaching of the value of different foods and a training in marketing and cooking in schools may have an influence in the future" Any measures to improve these habits should yield a great return in a healthier community

It is easier to point the need than to advance practicable remedies, but I would suggest the following as all desirable

In the first place the local public health authority, including both the public health and education departments, should undertake educational work on food as part of its routine work Something can be done by the issue of suitable and simple leaflets showing the relative value of food in terms of their cost, emphasizing the importance of nutrition in preventing infection from chronic disease, and the value of those subsidiary foods which are often neglected Leaflets are, however, a poor means of instruction, and more is to be expected from verbal instruction

The inadequate time allotted to *the teaching of* health factors, including *the value and use of foods, to our school* children is a standing disgrace to our educational system We turn out children from school with much knowledge which disappears with remarkable rapidity, but we do *not* see that they leave school with a knowledge of the fundamental basal facts of physiology and hygiene, which *would* not be forgotten if adequately taught, and which would be a guiding light for the rest of their lives For this inadequate instruction I feel the Board of Education is *primarily* at fault, since this branch of instruction is not insisted upon as an essential subject, but is merely taught, when taught at all, as odd lessons to fill up class intervals in the school programme I am aware that many teachers are not instructed themselves in *this work*, but that should be remedied, and soon would be if this branch of education received the *fundamental place* which its importance entitles it to receive

Even in our own *profession we learn* a great deal as to diet in relation to disease, but not enough in regard to the diet necessary *for healthy living* The essentials of dietetics should be a primary part of the instruction of health visitors, district nurses, and others who have influence as teachers, in order that amongst their activities should be incorporated instruction in sound *food habits* At the present time it is taught, but to an inadequate extent

Instruction given by such persons would take many forms according as opportunity offered Examples of *what it should* include are information as to the relative value of different foods per unit of cost, the relative cost of tinned and fresh foods, the value of the stew and the stockpot, the cost of cooking and how to reduce it, good and bad cooking methods, avoidance of food waste, the need for vitamins and their sources, the essential qualities and value of milk and the need for clean milk, the proper storage of food, the need for variety in food and how to obtain it, the value of good dietary habits, such as regularity and sound mastication, the importance of a good meal for children in the middle of the day, and much other information which we know to be valuable and essential

The newspapers might be *utilized* in this country much more than they are as instruments to impart useful dietary information At present we have plenty of food stunts but little food education Some of the foods foisted on the public by persistent advertising would never earn the money to pay for the advertisements but for the credulity based on ignorance of food *matters*, which they so cleverly exploit

I have in mind a process of education which has as its ultimate object the eradication of the present faulty notions and the substitution of a sound practical knowledge of how the community should live as regards its diet I believe this is possible although difficult Dietetics is a difficult subject to expound to the uneducated It needs a basis of physiological knowledge to appreciate it That blessed word "calories" is not easy to explain, while difficult to evade For this reason we need teachers who really understand and who are not merely armed with a veneer of technical knowledge over a basis of nothing The lack of adequately trained teachers is probably our greatest difficulty, but one which is not insurmountable

Another serious difficulty is the want of unanimity in the profession as to what are the exact facts we want to teach, a difficulty not lessened by the remarkable advances which are being made as to the factors in nutrition We know enough, however, of ascertained fact to serve as a basis of sound teaching

I believe that it is possible by means of a properly thought out scheme to bring the mass of the people into touch with sound knowledge of food and in a few years to overcome the crusted prejudices of age Our people persist in faulty dietetic practices because no adequate steps are taken to enlighten them The pessimist will declare it is not practicable He said the same over infant feeding and rearing, but it is being done before our eyes, and it can be done—with more difficulty but probably with equal success—for the wider subject of diet control and good food habits I can think of no advance in public health work which is likely to reap a better harvest in the improvement of the health of the community

GENERAL DISCUSSION

Dr H SCURFIELD (Folkestone) believed that the national physique could be greatly improved by a better dietary, and brought forward a few practical points First, they ought to know better what they were buying, the addition of chemicals and preservatives to food should be prohibited in some cases and declared in all Foods should not be sold under misleading names—for example, tinted cornflour as a substitute for eggs Starchy infant foods should be controlled Although there were regulations for dried milk, a skimmed or half-cream dried milk could escape the regulations if 31 per cent starch be added to it In the second place, they should take warning from the politicians, and not tie themselves down with shibboleths, such as natural foods," "no fractionated foods," "only perishable foods are good," etc, but apply the knowledge they possessed to determining the essential goodness of every food used for man For example, cow's milk and hen's eggs were not natural foods, and butter was a useful fractionated food Perishable foods might be treated so as to make them keep—for example, dried milk and eggs His third point was that if their advice was to have weight with the public they should concentrate on their agreements For instance, all vitamin workers said they should consume more milk, vegetables, and fruit Those who were keen on mineral salts found that the same "big three" were the best source of mineral salts The crusaders against constipation recommended fruit and vegetables and were not averse to dairy products The dentists recommended fruit, vegetables, and wholemeal bread for keeping the teeth clean, many of them were convinced of the value of the lime, good fat, and protein of milk for building good teeth The "nut" school recommended a food which gave exercise to the jaws, cleansed the teeth, and was a good source of vitamin B Even those who were against milk did not object to milk products without the water Recent milk conferences had shown that there was not much to choose between the various forms of safe milk in food value, and Dr Scurfield did not think the advocates of ordinary raw milk for children as an immunizer against human tuberculosis would have a big following in view of the 3,000 deaths and corresponding damage rate in this country from milk tuberculosis annually The increased use of all kinds of milk was good for agriculture, and they could surely unite to recommend the greater use of "safe" milk, leaving the public to choose whichever "safe" milk it preferred There was probably general agreement that sucking of sweets and eating biscuits between meal was bad for teeth and stomach, and that three meals a day and nothing in between was a good rule for children Leaflets, similar to those issued by the U S A Board of Agriculture on the various foods and the best way of preparing and cooking them so as to retain their value, would be extremely useful Concentration on the agreed points was very important, most of them agreed in the main as to the better dietary needed

Dr ROBERT HUTCHISON (London) had been asked to deal with the subject under discussion from the point of view of "*the effects of defective feeding during early life on the constitution of the adult*" When he came to look into the matter, however, he found that they really knew almost nothing about it They did know indeed, that prolonged underfeeding in early life might permanently impair physique, as to that there was a good deal of evidence Dr Clement Dukes, for instance, drew attention many years ago to the greater weight and height of public school boys compared with boys of the same age in elementary schools, and similar observations had been made in America It had even been suggested recently that the small stature of some races, such as the Japanese, was due to diet rather than to climate Whether the impairment of physique resulted from an all round calorie deficiency in the diet to poverty in one ingredient such as fat to lack of vitamins or, as Dr Orr had suggested, of mineral constituents did not much matter In order to produce its effects, however, the diet defect must continue over a long time The effects appeared to be most pronounced when it was *operating during the time at which growth was most active* —that is to say, in girls between 12 and 15 and in boys between 14 and 17 Deficiencies during the first year of life did not seem to matter so much He had often been struck by the fact that babies who were badly marasmic during their first year might become quite flourishing children later on this had also been observed in the case of the subjects of congenital pyloric stenosis, even though they were virtually starved for their first five months Physique and health were not synonymous, and their problem was, What was the effect on health of early bad feeding?—assuming of course, that when adult life was reached the diet had become adequate They had here no accurate data to guide them, but on *a priori* grounds, and for the purposes of discussion, he submitted that there was no reason to suppose that the health of the adult was seriously impaired by underfeeding in early life Was there, for example, any reason to suppose that the efficiency of any of the great vital organs could be permanently damaged by malnutrition in childhood? They knew from experiment how resistant the central nervous system was to starvation was the heart likely to be any more affected, or the kidneys? There was more reason, perhaps, to expect some permanent weakening of the digestive organs from early underfeeding, but even this seemed *doubtful* Was there, then, any impairment of general resistance to disease? They did not know, but it did not appear likely *There did not seem to* be any correlation between physique and natural resistance, big and robust subjects being so far as one could judge, just as likely to be attacked by acute infections, and not any better able to overcome them, than the small and "weedy" Perhaps an exception should be made in the case of tuberculosis, but there the seeds might have been sown in the early years while the defective feeding was still operative, although it must be admitted that poor chest development, by hampering the lungs, might favour the development of the disease There remained the question of possible impairment of fertility or longevity, but as to these they had no data at all Although no one ought to be dogmatic about it, he urged, therefore, that with the possible exception of liability to tuberculosis, there was no reason to suppose that defective feeding in the early years —always assuming that it was rectified later—had any bad effect on the health of the adult There was reason to expect, however, that accurate information would be forthcoming in greater measure in future, for during the war the Central European populations were for three years at least badly underfed, and, assuming that their nutrition

had now become normal, they should soon be able to tell whether any permanent injury to the health—in contrast with the physique—of these populations had resulted

DR J B SIMPSON (Golspie, N B), speaking as a general medical practitioner in the Highlands of Scotland, regretted the change of diet that had occurred amongst the population there during the past twenty or thirty years In former times the dietary consisted of oatmeal porridge, mutton broth, eggs, and milk, now it seemed to be mostly tea, jam, and white bread The old stock was extremely good, but the same could hardly be said of the present in comparison There was relatively a large number of cases of tuberculosis on the north-western coast, might not this be due to lessened resistance to infection produced by deficient dietary?

DR A L HOOPS (Principal Civil Medical Officer, Straits Settlements) described at some length the deficiency diseases met with in Malaya, the chief of which was beri-beri It had been the custom to grind rice by manual labour in the gaols—a procedure which provided excellent hard labour for the prisoners and also an excellent article of diet, for so long as they used that imperfectly ground rice they were not troubled with beri-beri It was not so in the labour camps, for the labourers demanded white rice, and it pleased the employers to supply it, as it kept better than the native ground variety The great difficulty they had to contend with was the insistent demand for the over-milled white rice

DR BOYD ORR, in reply, concurred with Dr Scurfield's remarks upon the necessity of informing the public He did not doubt that there were many unknown food factors which in the light of further research would claim a place in the efficient dietary, but for the present it would be well to concentrate on the points of agreement and give the public the benefit of their knowledge He accordingly moved the following resolution, which was seconded by Dr Scurfield, and carried unanimously

> "That it be a recommendation to the Council to appoint a Food Committee, on which there should be representatives of the Society of Medical Officers of Health, for the purpose of
>
> 1 Conducting an investigation into the adequacy and suitability of the dietary of the people of this country,
>
> 2 As the result of the investigation making such recommendations and drawing up such directions as may appear desirable,
>
> 3 Conferring with the Ministry of Health, the Medical Research Council, and other bodies, and
>
> 4 Dealing with food problems as they arise"

SECTION OF DERMATOLOGY

J M H MACLEOD, M D, F R C P, President

DISCUSSION ON RADIOTHERAPEUTICS IN DERMATOLOGY

OPENING PAPER

BY

J H SEQUEIRA, M D, F R C P, F R C S,

Physician to the Skin Department and Lecturer in Dermatology, London Hospital

I HAVE first to offer my grateful thanks for the honour you have done me in asking me to open this discussion, but the council of the Section has imposed upon me a task of great difficulty An address on radiotherapy, which includes all forms of treatment of diseases of the skin by radiations, is an undertaking of great magnitude, and can only be dealt with in broad outline in the time at my disposal

Radiotherapy, including phototherapy, dates back to 1895, and there is no hesitation in saying that the work of Finsen on the one hand, and the discovery of the therapeutic value of the x rays by Schiff and Freund on the other, mark the beginning of an important epoch in the treatment of diseases of the skin Powders, lotions, pastes, ointments, even the curette used in the local treatment, are supplemented by radiations of remarkable variety and undoubted efficiency From the red end of the visible spectrum, through the violet to the ultra-violet, and the series of radiations which we class as x rays, we have undulations of differing therapeutical properties which under our control and which we are able to utilize in the treatment of disease

Those of us who have been privileged to watch the infancy and adolescence of this new therapy cannot help feeling gratified at its progress We have had our periods of extreme optimism succeeded by waves of pessimism, but there has always been progress—here rapid, there slow The solar spectrum and the spectra of various artificial illuminants have been studied, and we are learning the type of radiation best adapted to produce a definite clinical result

In our use of the x rays we passed through a stage of blind working attended with grave danger to both patient and operator The catastrophes of these early days led directly to the invention of instruments of precision by which has been gradually evolved a technique which enables us to determine with considerable accuracy, not only the quantity, but the quality of the radiations used We have learnt how to filter out certain types of ray for special purposes The effects of these radiations on healthy and diseased tissues have been carefully investigated, and experimental work has been carried out in animals by numerous workers I need only refer to the literature on this subject to indicate that the scientific side of the subject is receiving adequate attention To-day, my remarks must be directed to a short survey of the clinical side

ROENTGEN THERAPY

The effects produced by the radiations from an x ray tube on the human organism may be classed as (*a*) *local*, (*b*) general

(*a*) *Local Effects*

The local effects are (1) superficial, (2) deep

(1) *Superficial*—The earliest noticeable effect produced by radiation from an x ray tube is epilation The fall of hair begins about a fortnight after the exposure A slightly greater dose of rays produces an erythema An erythema dose will very likely be followed by permanent loss of hair Still longer exposures will cause vesication, ulceration, and even necrosis Vesication, ulcer, and necrosis due to the Roentgen rays are intensely painful, of long duration, and the graver lesions may never heal Even moderate grades of inflammatory reaction are followed by carcinoma, but this is more commonly the result of repeated exposures Severe burns, leading to deep ulceration, were not infrequent in the early days of radiotherapy, and were then usually due to cumulative dosage That these serious effects may be entirely removed by the use of the direct measurement of the rays by the Sabouraud-Noire pastille is shown by the fact that since their use in all cases treated in my department, 250,000 exposures have been given without causing dermatitis I can only here repeat what I have said elsewhere, that we owe these gratifying results to the careful carrying out of the prescribed technique I personally have less confidence in what may be called the indirect methods of measurement The only severe burns I have seen recently have occurred in the practice of radioscopy

(2) *Deep*—By the use of appropriate screens of aluminium and certain other metals of low specific gravity the rays may be filtered so that the superficially acting radiations which cause burns are cut out and the more penetrating rays only reach the treated area Doses equivalent to 4, 6, 8, and even 10 pastille doses can be given with the certainty of avoiding dermatitis by using aluminium screens in the scale worked out by Mr Blackall and myself These penetrating rays have a pronounced influence on certain glandular organs, on lymphoid tissue, and on some neoplasms, notably the sarcomata In 1901 we cured sarcomata with small gas tubes costing only 12s 6d The effects are similar to those produced by the beta and gamma rays of radium and I have not changed

the opinion I pronounced in Brussels in 1908, that there is very little which radium can do which cannot be done by the *x* rays, although I acknowledge the greater convenience of radium in many cases and the impossibility of applying the *x* rays in others where radium can be used with facility

In Diseases of the Skin

My assistant, Mr Cooper, has classified the skin cases treated in the *x* ray room during the past fourteen years and a summary of his figures shows that in my practice at the London Hospital *x* ray therapy is used for several types of dermatosis

(1) *For the Relief of Itching and in Pruriginous Skin Diseases*.—Pruritus ani and pruritus vulvae in which no local cause can be discovered are frequently relieved by occasional exposures As a rule benefit is manifest after the first sitting, and if there is not speedy relief it is unwise to persist with the rays Eczematous lesions often due to scratching, in these conditions are benefited not only by relieving the pruritus but by the local action of the rays In lichen simplex and other forms of lichenification which may persist for years, the application of the *x* rays, by relieving the itching, breaks a vicious circle and may very often effect a cure, especially if the parts are protected with zinc plaster between the exposures to the rays In all cases I allow an interval of three weeks between successive exposures.

(2) *In Psoriasis and Chronic Seborrhoides*.—Where the eruption in psoriasis is limited an occasional *x* ray treatment is of great value The lesions rapidly disappear but the tendency to relapse is not removed In some cases it has appeared to me that the intervals are lengthened Short exposures to radium act similarly In some forms of seborrhoeic dermatitis the *x* rays have a rapidly beneficial effect moist lesions dry up, scaly lesions disappear When the scalp is badly affected the depilatory action of the rays may be used with advantage the removal of the hair permitting more thorough treatment by topical remedies

Cheilitis Exfoliativa.—This chronic scaly eruption of the lips has always been refractory to treatment, but I have had several striking successes from *x* ray therapy

(3) *In Keratoses*.—Diffuse thickenings of the horny layer of the skin are commonly benefited by exposure to the *x* rays, but in general these conditions are better dealt with by other measures Verrucae, common warts, and seborrhoeic warts of the scalp and trunk, although removable by *x* rays are more conveniently dealt with by radium or by carbon dioxide snow in the majority of cases Flat warts especially those of the beard region in the adult, will sometimes disappear under *x* rays, but there are many failures The plantar wart is almost certainly cured by one or more heavy doses (1½ to 3 pastilles) applied exactly to the lesion If multiple doses are given, an interval of three weeks should elapse between the sittings

Tuberculosis.—The first cutaneous disease treated by the *x* rays was lupus vulgaris, and though no one can deny that the results are beneficial in certain types of case I am strongly of opinion that much harm has been done in others There are essentially two very distinct types of lupus—one in which there is ulceration, and the other in which the lesions are dry throughout In the ulcerative form and in the closely allied condition scrotuloderma due to infection of the skin by the breaking down of tuberculous foci in glands, bones, and joints, the *x* rays are of great service A few applications at intervals produce a rapid healing of the ulceration and the disappearance of gumma-like swellings After the ulcers have healed it is common to find isolated dry nodules in the cicatrix, and these require treatment on the same lines as dry lupus In dry lupus the nodules are yellowish brown spots, or translucent jelly-like appearance, embedded in the skin There may be a thickening of the horny layer over these nodules This type can only be removed by the *x* rays by pushing the treatment to an actual dermatitis, and after treatment pushed to this extreme, or repetition of the *x*-ray applications over several years (a not uncommon thing), we meet with the tragedy of lupus carcinoma I know there are some who will not believe that lupus cancer is often the result of *x*-ray treatment They point out that cancer was well known as a complication of lupus before the *x* rays were discovered I entirely agree, but my clinical experience is that there has been a great increase in these cases For some years past we have been seeing one after case of rapidly advancing carcinoma which can only be attributed to over-treatment by *x* rays I have frequently spoken and written on the subject, and I beg all concerned to avoid prolonged treatment of lupus, or, indeed, of any cutaneous affection, by radiotherapy

Granuloma.—Granuloma (mycosis) fungoides was first treated by the *x* rays by the late Dr Allan Jamieson I do not think there is another condition in which such striking results are obtained Large intractable tumour disappear in a remarkable manner, areas of infiltrated skin become soft and supple, and the intolerable itching is allayed Unfortunately, the improvement is often temporary, the infiltration and tumour formation return, but by repeated treatments the patient's life is prolonged, much suffering is relieved, and we are able to avoid the distress and discomfort produced by septic ulceration of fungating masses, which was usual before the introduction of radiotherapy Kaposi's disease, so-called multiple idiopathic pigment sarcoma, which we now class as a hæmangioma granuloma of the extremities, is also benefited by *x* ray treatment I have a patient who has been kept free from grave discomfort for eleven years by occasional courses of radiotherapy

Leprosy.—In 1901 I treated a case of nodular leprosy by *x* rays, and by repeated short exposures was able to remove the nodules, but, of course, the patient was not cured. I have repeated this treatment in other cases with similar benefit

Keloids, and Hypertrophic scars, such as occur in acne, are amenable to treatment by the *x* rays and by radium Thickening, redness, and subjective symptoms are removed, and a soft, pliable, pale cicatrix is left

Carcinoma of the Skin.—My first experience of radiotherapy was in 1900, when Mr Jonathan Hutchinson sent me a case of rodent ulcer a very extensive case with the request that I would submit it to Imison treatment It was so ulcerated and sore that it was quite obvious the patient could not stand the pressure of the pressure glass, and, remembering Freund and Schiff's results in cases of lupus, I determined to try *x* rays The patient was exposed to the rays for ten minutes every second day, and the result was so striking that it led me to treat a large number of cases Another patient, with a large rodent ulcer in front of the ear, was treated by *x* rays three times a week with the result that an ulcer of twenty-five years' duration was healed I soon found that there were cases in which the resistance of the edge delayed cure, and in these I used the curette freely, removing all the thickened border, converting the whole into an ulcer, and then I applied the *x* rays to the raw surface Many admirable results were thus obtained The earlier diagnosis of rodent ulcer has led to an almost complete disappearance of the grave cases, formerly so common in the clinics Radium has been used in 1,262 cases in my department, and I find that small rodent ulcers not involving bone or cartilage can usually be cleared up by three exposures of two hours' duration to a half strength radium plate Where bone is involved the *x* rays in heavy doses may be used in conjunction with surgery

Squamous carcinoma does not respond to *x* ray or radium treatment, and in no case would I recommend either measure instead of operation The use of the *x* rays as a prophylactic measure after the removal of other forms of cancer, particularly mammary cancer, was dealt with for years in my department, but the exigencies of the work and the introduction of newer methods led to their being transferred to my colleague Dr Gilbert Scott

Appendages of the Skin

Ringworm of the Scalp and Beard.—The depilatory effect of the *x* rays led to their use in tinea I do not propose to enter into details of the *x*-ray treatment of scalp ringworm Thanks to Sabouraud and Noiré's pastille and to the tintometer of Corbett and Dean, and to the exact regulation of distances which we owe to Kienboeck and Adamson, the technique for epilation of the scalp in tinea capitis can

be carried out with precision In my own clinic 7,143 cases have been treated during the past fourteen years In only four cases have I been able to trace a partial alopecia, and this may have been due to idiosyncrasy Incomplete epilation has, of course, occurred in a small proportion of cases I cordially acknowledge the care and attention of the assistants engaged in this particular work, to whom we owe the admirable results recorded above I should like to mention that owing to the fact that we have treated hundreds of children from certain orphanages we have been able to prove that there is no risk whatever to the brain, and that in a large proportion of cases the hair grows stronger and thicker after the epilation I should add that as a rule we treat no children under 4 years of age The results in tinea barbae are equally good It must be quite understood that the rays do not kill the fungus, they merely bring out the infected hair It is, however, interesting to note that eczematoid ringworm of the extremities is often benefited by a short exposure to the rays

Sycosis—I am unable to give so good a report on the x-ray treatment of coccogenic sycosis In a few early cases a cure is obtained, but in many cases epilation produced by the x rays produces only a temporary improvement in the condition Relapses are exceedingly common in the chronic cases In some instances one is obliged to produce a permanent epilation before a cure is effected This is often followed by atrophy and a vulnerability of the skin leading to recurrent inflammation, especially on exposure

Hypertrichosis—Many dermatologists have used the x rays for the removal of superfluous hair, and at one time an improved technique appeared to give most gratifying results Unfortunately, in a certain proportion of cases, the removal of the hair permanently has been followed by the appearance of slight atrophy with ugly telangiectases on the radiated skin and on the mucous membrane of the lips *It is, therefore, a method of treatment which should not be undertaken except in certain grave cases in elderly subjects, to whom the possible disfigurement should be carefully explained*

Hyperidrosis—There is no doubt that x-ray treatment carefully applied, as Howard Pirie first showed, is of service in the relief of certain types of hyperidrosis The rays have a distinct influence on the sweat glands without the production of a reaction sufficient to cause atrophy

Sebaceous Glands—The beneficial effect of x-ray treatment in acne vulgaris would appear to be in part due to its influence on the sebaceous glands There is often some increase in the activity of the inflammatory process as an initial effect of the exposure of the rays, but the subsequent benefit is pronounced

(b) *General Effects*

Influence of X Rays on the Viscera and Blood—It is important for the dermatologist using x rays to be aware of the influence of these radiations on certain organs and on the blood It is generally known that the seminiferous tubes of the testes are exceedingly sensitive, and that sterility, complete or partial, temporary or permanent, may follow exposure of the testes to the rays, especially if repeated It has also been shown that penetrative doses will cause disappearance of Graafian follicles and even complete atrophy of the ovaries, and the treatment of menorrhagia and fibroid of the uterus is based on this observation Radium acts similarly The rays also have an undoubted influence on the thyroid gland, and this fact has been utilized in the treatment of Graves's disease It is claimed that deep radiation applied to the thymus has a curative effect in certain cases of psoriasis *X rays* and radium, especially in cumulative doses, have a marked influence on the blood I believe Senn was the first to show that an enlarged spleen and glands in leukæmia will diminish under x-ray treatment, and the leucocytic count is materially diminished In a few instances it has been found that prolonged exposure to the x rays has great influence on the red cells With the use of more powerful tubes it is impossible to say that the precautions introduced for the protection of the worker when weaker apparatus was used are sufficient The grave effects of overexposure to radium are now well known, the fatalities in radium workers being due to an aplastic anæmia The effect coming on soon after massive doses of x rays applied to large portions of the body in attempts to prevent the dissemination of cancer are usually transient Malaise, anorexia, nausea, vomiting, and collapse are the chief *symptoms, but,* although grave complications are rare, fatalities have been recorded All workers with the x rays should study Sir Humphry Rolleston's admirable and timely address on acute constitutional symptoms due to radiations He concludes that these symptoms are probably due to flooding of the circulation with proteins liberated by the destruction of cells Experimentally it has been shown that they may be due to direct damage to the mucous membrane of the small intestine, and this is supported by clinical evidence, but clinical evidence also shows that destruction of cells in large tumours elsewhere—for example, the neck or mammary region—may be followed by acute constitutional symptoms

PHOTOTHERAPY

Under this term I propose to consider the *treatment* of disease by sunlight (heliotherapy) and by *artificial* illuminants

Like Roentgen therapy, phototherapy has to be considered as to (*a*) local effects, (*b*) general effects We owe to Finsen the first scientific application of light for the treatment of disease He showed by experiment *that the various parts of the spectrum* (visible and invisible) have different properties He demonstrated by simple *experiments that* the so-called sunburn is a reaction of the skin to the actinic rays of light Actinic light has very little penetrative power, and penetration of vascular tissues is very small indeed By experiment Finsen showed that the red colouring matter of the blood is an important factor in preventing this penetration The shorter radiations *penetrate* less than those of longer amplitude For therapeutic purposes the greatest penetration is obtained by *concentrated* sunlight, or, what is more convenient in northern latitudes, concentrated rays from a powerful carbon arc, on a surface rendered anæmic by compression The heat rays of the sun or arc light must be removed by a cooling apparatus, which is in practice combined with the compressor

(a) *Local Effects on the Skin*

About six hours after the exposure of an area to concentrated arc light for an hour an acute erythema occurs This is followed by vesication, and the vesicles may take several days to heal Pigmentation of moderate degree is common after such an exposure Actinic light differs from the x rays in that it has the power to destroy micro organisms, but it is believed that in the case of tubercle bacilli in the skin, as in lupus vulgaris, it is the inflammatory reaction rather than the direct bactericidal action of the rays that kills the bacilli

Lupus Vulgaris—Finsen therapy is the ideal method of dealing with cases of lupus vulgaris of the dry type, *especially* where the lesions are situated, as in the majority of cases, on the face, and it is important to obtain a good cosmetic result, from 60 to 70 per cent of cases of lupus are cured by Finsen therapy—that is, local application of concentrated light alone The use of mercury vapour lamps —for example, that of Kromayer—in the local treatment of lupus, combined with compression to permit penetration, is of service in a number of superficial cases

Phototherapy in other Skin Conditions—In my experience *phototherapy* has very little influence on lupus erythematosus In some cases it is distinctly harmful In the early days of Finsen treatment success was reported in superficial rodent ulcer by Finsen himself and by Morris and Dore, but *x rays and radium are more efficient*

Phototherapy without compression is very largely used and with advantage, in my experience, in a limited number of cases I have seen it beneficial in the relief of pruritus but it is less efficient than the x rays, though certainly safer if treatment is to be prolonged It is of value in the treatment of certain superficial microbic affections, and is of undoubted service in some types of alopecia areata

Dr O'Donovan has recently shown that extensive psoriasis can be removed by prolonged *treatment of this* type

(b) *General Effects of Light*

Like the *x* rays, the sun's rays and the radiations from a powerful artificial illuminant have a marked influence on the human body generally. Fortunately, we have here to record very little but what is good. The exposure of the whole surface of the body to the sun's rays, as shown by Bernhard and Rollier in the Higher Alps and by Gauvain at Alton and Hayling, is of great therapeutic value in certain forms of tuberculosis. In latitudes where the sun's rays are not available powerful carbon arc lamps have proved of nearly equal value, as shown by Reyn. Lamps giving a highly actinic light, such as is produced by incandescent mercury vapour, are also of value. We have used both illuminants during the last two years at the London Hospital.

The exposure of the whole body to light in the light bath produces:

(1) Erythema in the irradiated area. This is usually transitory, and may be followed by desquamation.

(2) Pigmentation. The degree varies with the duration and number of exposures, and with the individual. The source of light also has an influence. The carbon arc causes a deep brown colour, while the mercury vapour lamp produces a greyish brown tint. This, no doubt, depends upon the greater penetration of the rays of the carbon arc.

(3) A moderate increase in the body weight observed in some cases.

(4) A slight increase in the leucocytes was noticed in a few of my patients.

(5) An increase in the bactericidal action of the blood, but in some instances there is no change, and it seems probable that this observation may have a prognostic significance (Colebrook).

(6) Steady improvement and actual healing, without local treatment, of surgical tuberculosis and especially of lupus vulgaris both of the skin and mucous membranes. In lupus the combination of local light treatment (Finsen therapy) with the light bath gives 90 per cent. of cures. Our experience in this respect agrees with that of Reyn and his assistants.

(7) A marked improvement in the general health of the patients, although Dr. Argyll Campbell found no change in the basal metabolism of patients examined in my clinic.

The only untoward result seen in light bath treatment, whether the illuminant is the sun or an artificial source, is the occasional "flare up" of a tuberculous process, especially where there is pyrexia. Such are not uncommon in pulmonary tuberculosis. In a case of hilum phthisis with cutaneous tuberculides treated in my clinic the light bath was certainly of no benefit, and apparently did harm. It is therefore wise to begin the treatment of cases of visceral tuberculosis with very short exposures limited to small areas, and to watch carefully the effect on the temperature and other symptoms. It is generally accepted that the patients whose skin pigments best make the most rapid and complete recoveries. It appears to be doubtful whether the pigmentation itself is more than an index of some chemical change in the blood which produces the improvement in the general and local conditions.

In conclusion, I trust that the somewhat cursory survey I have been able to submit to you shows the importance of the careful study and further investigation of the properties of both the *x* rays and light rays. Finally, I would suggest that, especially with regard to the light bath, extensive observation should be made in other conditions than those mentioned. We know that rickets can be prevented by the light bath, we know also that these measures are of service in convalescence from acute febrile illnesses, especially measles and pertussis. There is reason to hope for benefit in other conditions, and the opening of clinics supplied with the necessary apparatus in various centres leads one to urge that observers should not hesitate to try to extend the scope of usefulness of these valuable therapeutic measures.

[The address was illustrated by numerous lantern slides.]

REFERENCE.

1 British Medical Journal, 1923, i, p. 1.

S. L. DOPE, M.D., F.R.C.P.,

Physician in Charge of the Skin Department at Thomas's Hospital, London.

Dr. DORE said he was glad to have the opportunity of following Dr. Sequeira in this discussion because Dr. Sequeira had been one of the pioneers of the subject, and had not only an extensive experience of all its branches but also the necessary judgement to form a just estimate of its relative value in therapeutics. Dr. Sequeira's experience dated from the year 1900, and at about the same date that the Finsen light treatment was introduced at the London Hospital he (*Dr. Dore*) had observed the results of this particular method of concentrated light treatment in cases of lupus vulgaris in conjunction with the late Sir Malcolm Morris, who installed a Finsen lamp in London. It was, of course, principally for lupus vulgaris that the Finsen light was, and is still, used, a few conditions, such as alopecia areata and rodent ulcer, were found to benefit to a less extent, and other cutaneous affections were treated, but the improvement was not greater than that obtained by other methods. Stress was laid on this point because phototherapy had recently received a fresh impetus from the discovery of its effect on rickets and on surgical and other varieties of tuberculosis and was being discussed now as a new or almost new system of treatment. The speaker had used nearly every form of apparatus emitting ultra-violet rays, and had come to the conclusion that in therapeutic value as regards cutaneous affections they fell very far short of *x* rays in general applicability and in permanence of results. The reason for this might perhaps be found in the fact that the far ultra-violet rays, unlike the near ultra-violet rays although strongly bactericidal, did not penetrate the skin.

Radium, again, was limited in therapeutic value by the small amounts available and the small area treated. From the dermatological standpoint it was chiefly in suitable cases of rodent ulcer, keloid, and some vascular naevi that radium was of special value.

The *x* rays had a much larger field of action, and were useful in a variety of cutaneous diseases on account of the various properties they possessed. The biological effect of *x* rays was still to a large extent unknown, but some sort of classification of their therapeutic properties might be made as follows:

Stimulating action—the effect of small doses as made use of in the treatment of chronic eczema, varicose ulcers and ulcerating lupus. (Experience had shown that prolonged treatment of lupus vulgaris was not only useless but often disastrous.)

Inhibitory and destructive action on young and actively growing cells—for example in carcinoma, sarcoma, mycosis fungoides, psoriasis, etc.

Atrophic or paralytic action on glandular structures—for example in seborrhœa, acne, hyperidrosis, etc.

Purulent or keratolytic action on horny tissues—for example, in warts and corns, senile and other keratoses.

Anæsthetic action on pruritus—for example pruritus ani.

Epilatory action—for example in ringworm, sycosis, and also in hypertrichosis in which however *x* rays should be avoided.

This scheme was not intended to be an exact interpretation of the properties of *x* rays, but only to give an idea of their relative value in treatment.

GENERAL DISCUSSION

The PRESIDENT of the Section (Dr. J. M. H. MACLEOD), speaking of the estimation of the dosage of *x* rays, said that since the introduction of the Coolidge tube it was possible to obtain accurate results from the indirect method, but that it was wise to control the dosage with the pastille, and that it was important only to use pastilles which were properly standardized. Referring to the treatment of hypertrichosis with *x* rays, he said that the procedure was to be deprecated, since it was not possible to depilate permanently without causing more or less serious atrophy of the skin. Mention had been made of the use of radiotherapy in the treatment of leprosy. He desired to emphasize the need of care in treating nodular lesions, as they were liable to slough. Since the problem of leprosy was much the same as the problem of tuberculosis, benefit from open air life was undoubted, and in spite of the fact that

leprosy was most prevalent in countries where sunlight was intense he thought that in cases of leprosy in this country actinotherapy, both general and local, was worthy of trial

SIR NORMAN WALKER thanked Dr Sequeira for his reference to the fact that Dr Allan Jamieson was the first to use x rays in the treatment of mycosis fungoides, a method of treatment which had added years of comfort to scores of persons He congratulated Dr Sequeira on his ringworm statistics 7,000 cases with only four poor results was an achievement anyone might be proud of With regard to the light treatment, he could say after a long experience of lupus that no other treatment had been followed in so short a time by such excellent results, and he thought it would be well to wait a while before deciding that light treatment was harmful in some other forms of tuberculosis On the other hand, he had tried it in psoriasis with disappointing results, and asked Dr Sequeira if he had observed any difference of effects in patients of different complexions The late Professor Nevins Hyde long ago advocated the treatment of this disease by light, and he himself thought that the diaphanous and scanty clothing of the young ladies of the present day had had some influence in diminishing psoriasis on the upper trunk With regard to hypertrichosis, he agreed that in the present state of their knowledge the use of x rays was unjustifiable, but he looked forward to the possibility that some day it might be practicable to ascertain the exact dosage In conclusion Sir Norman Walker once more emphasized the danger of treating lupus with repeated doses of x rays

DR RUPERT HILLAM (*Sheffield*) said that Dr Sequeira had been a pioneer and an enthusiastic advocate of radiotherapy in the treatment of skin diseases, but that those who had listened to his paper would agree that he had not overestimated its value He was interested to hear his remarks on the abuse of x-ray therapy, and particularly desired to refer to the prolonged treatment of lupus by x rays The subject had been already discussed that day and also the previous day, but he did not hesitate to refer to it again, for this method of treatment was still going on Further, he thought that Dr Sequeira would agree that this treatment also caused the most appalling disfigurement owing to atrophy of the skin and subcutaneous tissue This was not the only form of abuse He had recently seen a severe radio-dermatitis of the vulva in an unfortunate patient who had been treated with repeated exposures to x rays for ten months in the hope of curing a pruritus He expected that Dr Sequeira's condemnation would be published in the BRITISH MEDICAL JOURNAL, and he hoped that perhaps it would bear fruit He had been rather surprised that Dr Sequeira had not mentioned the value of small doses of x rays in the treatment of that group of diseases which at one time sheltered under the name of eczema These patients formed a large percentage of those attending the speaker's clinic, and he was confident in stating that the results were most excellent, and that the patients were able to return to work weeks before those who were treated only by ointments and lotions Sycosis was certainly not one of the diseases which responded very satisfactorily to x-ray treatment Many of these patients suffered from blepharitis and had done so since childhood, he was inclined to think that blepharitis was often the original focus of the infection Personally he never epilated a patient with sycosis by means of x rays if the lids were affected

Regarding the treatment of lupus vulgaris by carbon arc baths, it might interest those present to know that for the last nine months he had been using carbon arc light produced by alternating current At first he had been somewhat disappointed with the results, but lately he had come to the conclusion that this form of current, although perhaps not so satisfactory as when the arc was produced by continuous current, was of great use in the treatment of lupus vulgaris It had been suggested that possibly in the future there might be some troublesome after-effects following prolonged light treatment It would be of material interest to hear whether Dr Sequeira had met with an epithelioma occurring on a scar of lupus which had only been treated by Finsen light

DR WILLIAM MITCHELL (Bradford) had abandoned the use of x rays in lupus, and now treated that disease either with ultra-violet rays alone or combined with preliminary curetting, or by diathermy He had treated 1,500 cases of ringworm of the head for the Bradford Education Committee without a failure He used a 12-inch coil, dipper interrupter with tachymeter, "Pilon" tungsten target tube, 2 mm aluminium filter, 0·5 ma current, Benoist scale 10B, interruptions 14,000, London pastille 4/5 B on the Lovibond tintometer He applied "Tabloid" head dressing, and inspected on the fourteenth and twenty-first days after exposure, when the school nurse completed the epilation His average time for cure was 21·3 days, and he had never had a return case He treated rodent ulcer mainly by diathermy coagulation, which he followed up with x rays when necessary If the case were of the hypertrophic variety he often curetted before applying diathermy

DR F HOWARD HUMPHRIS (London) said that Dr Sequeira's admirable exposition and masterly summary of the present-day relationship of radiology to dermatology left little to be added, but it was gratifying to hear his testimony to the value of actinotherapy, since no other man in England had had his experience or could speak with such authority The speaker, however, had not heard him advocate the combined use of x rays and ultra-violet radiation, using one remedy as a complement to the other This method had been brought into notice some time ago, and was of great value in some local treatments Cases of phthisis which flared up under the ultra-violet radiation were those which had several foci of infection, and were quite unsuitable for that form of treatment, even cases of pulmonary phthisis with only one focus must be treated with the greatest caution The use of ultra-violet radiation chiefly lay in the treatment of glandular and bony tuberculosis, apart, of course, from its use in dermatology One of the chief advantages of ultra-violet radiation over heliotherapy lay in its accuracy of dosage If one wished to give a dose of morphine one did not go and take a handful of poppies, make a decoction, and tell the patient to drink a mouthful occasionally, one administered one-sixth of a grain of morphine He suggested that in this country the sunlight was as variable in composition and intensity as a decoction of poppies, and sometimes it did not exist at all At best the patient got a "shot-gun" prescription, quite impossible to measure accurately

He desired to enter an objection to a statement of Dr Dore, who had said that the use of ultra-violet radiation was restricted, and that it had not so wide a range of utility in treatment as x rays The speaker was inclined to think that, so far from this being the case, it would be found that as the study of actinotherapy became more and more general and more and more thorough, ultra-violet radiation would ultimately have a wider range than x rays, not only in dermatology but in general medicine He believed that they were to-day standing on the brink of a great movement in support of treatment by artificial sunlight or accurate actinotherapy

DR J GOODWIN TOMKINSON (Glasgow) said that his experience of x-ray therapy of tinea tonsurans had begun when he was working in Sabouraud's laboratory in 1905, and since then it had been extended in his own clinics, at the Western Infirmary, and under the education authorities of Glasgow and Dumbartonshire Including his experience in private practice he had had only two cases which might be called unsatisfactory In one there had been some slight thinning of the hair on the left parietal region, not, however, enough to cause self-consciousness in the patient, and in the other a small area of baldness had persisted from some time in the same region As the patient disappeared from the clinic it was quite within the range of possibility that ultimately the hair grew again on the patch He attributed this immunity from gross accident to the fact that he never permitted the pastille to be darkened quite to the tint He desired to advise the careful measurement of all apparatus before attempting to epilate He had more than once found that the critical distances prescribed by Sabouraud had not been maintained Although x ray

therapy was the only method to be confidently recommended in the treatment of scalp ringworm, it was always with reluctance that he rendered a child bald for ten weeks, and he hoped that x rays were not the last word in the treatment of tinea tonsurans Unfortunately, x rays were not by any means invariably successful in sycosis, there might be an etiological reason for this In tinea tonsurans they were dealing with an infection from the exterior in sycosis, in many cases, the infection was very probably from within He was able to confirm what had been said about the amenability of tinea barbae to manual epilation and ordinary local medication Referring to Oriental sore, he had treated successfully with x rays six of these cases, one of which had developed in this country about four or five months after return from the East Four of these cases had formed the subject of a communication to the Aberdeen meeting of the Association in 1914 He believed that they were the first to be reported in Scotland

Dr HALDIN DAVIS (London) said that he had treated 700 cases of ringworm of the scalp, in only three of which had there been a small area on which the new hair had been rather thin He had had no case of persistent alopecia at all, and was inclined to ascribe the thinness of the hair in these three cases to fidgeting on the part of the child and the consequent slight overlapping of the doses He agreed with Dr Goodwin Tomkinson on the importance of keeping the tint of the pastille well below the full B tint The speaker never took it further than the 4/5 B tint on the Lovibond tintometer He had used the rays successfully in curing ringworm of the scalp in children as young as 18 months without any untoward result, and also in obstinate cases of infantile eczema In these very young patients he had employed very light anaesthesia, just enough to make them go to sleep

Dr H C SEMON (London) said that in his masterly synopsis Dr Sequeira had referred to the recent treatment of psoriasis by radio stimulation of the thymus gland, a method introduced by Brock of Hamburg in 1920 The speaker had employed it successfully in two cases, and there had been no recurrence of the eruption after two months in one case and three months in the other Both patients were girls of between 9 and 10 years of age The technique of the dosage was important, and care must be taken not to exceed one third of a pastille dose in children and one-half in adults, in both cases through a 2 mm aluminium shield The dose must not be repeated till after a month had elapsed, as, according to Brock, a paralysis of the secreting thymus cells tended to aggravate the condition Dr Semon desired to know if Dr Sequeira still practised occlusion of the tuberculous foci in the total arc-light bath treatment of lupus He had recently seen complete healing and involution of an ultra-destructive case of facial lupus at Polher's clinic at Leysin in six months in which no such precaution had ever been taken Acting on this hint, Dr Semon had now abandoned local shielding as soon as the body pigmentation was complete He had found no marked inflammatory reaction follow locally after the first or second exposure, and his impression was that involution was accelerated considerably by the procedure

Dr J HALL-EDWARDS (Birmingham) said that as one of the earliest workers he must bear the stigma of having been guilty of some of the atrocities mentioned He started treatment when the only instrument of precision used was the amperemeter In the treatment of lupus it must be remembered that the cases first submitted to radiotherapy were the derelicts of the then up to-date methods of treatment Many of these poor sufferers were without noses and ears, and their faces were horribly scarred as the result of numerous scrapings He could recall two cases which had quietened down as the result of x-ray treatment, they were both alive at the present time, and notwithstanding their disfigurement had had no serious return of the trouble During the last fifteen years he had not seen a case of so serious a nature This was evidence itself that modern methods of treatment had been in a measure successful, and in these methods the x rays had played an important part At the present time he only used the rays for lupus occasionally, he preferred the effects produced by radium combined with sunlight In the treatment of ringworm he had used x rays in over a thousand cases, and in no instance had the hair failed to reappear In only one case could he recall leaving a bare patch, and here, luckily he had warned the patient's mother of the possibility He disliked the method of producing epilation in a shorter time than five minutes in rapidly produced epilation the margin of error was so small that it was easy to overstep the safety line He always refused to treat a case which had been previously treated with mercurial ointment until at least three weeks had passed since the ointment had last been used and he always used tubes with a platinum target He was led to adopt this method by finding out that a tube with a tungsten target produced more reaction than one with a platinum target, even when the conditions were the same In the treatment of rodent ulcer he only used the x rays after the ulcer had been apparently healed by the application of radium He then administered a small dose of unfiltered rays once a month three or four applications being given Here again he would like to point to the fact that the cases of rodent ulcer which presented themselves to-day were nothing like so serious as those of twenty years back Whilst their methods of applying x rays were much more scientific and accurate than formerly, they still had much to learn He was not in favour of massive doses

Dr SEQUEIRA replying to the discussion agreed with Dr Dore that the x rays had a wider sphere of usefulness than the ultra-violet light but believed that there were possibilities of extending the use of the actinic rays He appreciated the variations in gas tubes mentioned by the President but preferred those tubes for dermatological work In such fine work as the treatment of tinea he found a rather slow development of the pastille change safer than the very short exposure required with very powerful apparatus Like several speakers, he did not exceed the 4/5 B tint Dr Goodwin Tomkinson was right in insisting on the exact technique, especially with regard to distance and the exact centring of the target of the tube slight divergences frequently caused unsatisfactory results He had not used anaesthesia for the administration of the x-ray treatment of tinea, but he did not apply the rays to children so young as those treated by Dr Haldin Davis With regard to the relative resistance of mature and immature cells, Dr Sequeira pointed out the great difference in the reaction of basal-celled carcinoma and the squamous and intermediate types to both x rays and radium He agreed with Dr Mitchell as to the rapidity with which rodent growths filled up cavities like the antrum, and especially as to the celerity with which cancellous bone was invaded In both conditions cure by x rays or radium was usually impossible With regard to the treatment of psoriasis by x raying the thymus, Dr Sequeira ventured to doubt whether an appreciable quantity of penetrative rays could reach the gland with the short screened exposures which were advocated He was gratified to have such cordial support from Sir Norman Walker, whose experiences with the artificial light bath treatment of lupus, as to both the local and constitutional effects tallied exactly with his own In reply to Dr Hallam's question he had had twenty-four years' experience of Finsen light treatment, and had not seen one case of carcinoma due to phototherapy In conclusion he expressed his satisfaction at the general condemnation of the excessive x ray treatment of lupus vulgaris, and in view of the fact that speakers had mentioned that it was still practised he proposed that a resolution should be sent to the Council of the Association, asking that the attention of the Ministry of Health should be called to the grave risks of carcinoma from the prolonged treatment of lupus vulgaris by the x rays

The PRESIDENT having ruled that such a resolution would be in order, it was moved by Dr SEQUEIRA, seconded by Sir NORMAN WALKER, and passed unanimously

> That the Section of Dermatology at the Annual Meeting of the British Medical Association (Bradford 1924) is of opinion that it would be advisable that the Ministry of Health should issue a warning to their tuberculosis officers of the danger of cancer following the prolonged administration of x rays in the dry type of lupus

ALOPECIA AREATA AND STRABISMUS FAMILIAL GROUPS.

BY

J GOODWIN TOMKINSON, M D,

Professor of Diseases of the Skin, Anderson College of Medicine Glasgow, Dispensary Physician for Diseases of the Skin and Physician in Charge of Skin Electrical Department, Western Infirmary, Glasgow, Dermatologist, Education Authorities of Glasgow and County of Dumbarton etc

AT the Annual Meeting held in Glasgow in July, 1922, I contributed a paper entitled "Alopecia areata and strabismus a family group of cases" Its publication in the JOURNAL educed letters from Dr Charles F Harford of London (September 30th, 1922) and Dr W Inman of Southsea (November 4th, 1922), and a reference in an article by the former gentleman, which appeared in *The Child* of January, 1924, entitled "Squint and the child mind" The following is a brief and partial summary of my first contribution

GROUP "A"

The family consisted of eleven members—father, mother, and nine children I examined seven of them Two children, both adults, were inaccessible, having emigrated to Canada, and the father and one son did not respond to my invitation to appear for examination Dr W Hislop Manson of the Glasgow Eye Infirmary reported strabismus present in six of the seven examined, and stated that the mother said the seventh occasionally squinted Hairs from four of the cases were examined microscopically by Dr G Haswell Wilson of Glasgow University Pathological Department, who also attempted to make cultures on Sabouraud's medium, but failed to discover anything microbic or mycotic by these procedures The mother stated that eight members of the family squinted—confirmed in six of them by Dr Hislop Manson Seven of the eight members, including the mother—a possible hereditary factor—showed at some time or other a pathological condition of the hair, which in six cases was alopecia areata and affected in three instances the whole of the scalp In four of these six cases the disease appeared, according to the mother's statement, in the occipital region The remaining (seventh) case showed only thinness of the hair An eighth child also had thin hair but did not squint There was a distinct neurotic history in the family, the mother having suffered at one time from "no feeling in the hands and head," and five of her children were very nervous, one being a somnambulist All of these squinted and had suffered at one time or other from alopecia areata

Since July, 1922, two familial groups, not so interesting as the preceding, but of sufficient interest and importance to warrant them being recorded, have come under my notice One of these occurred in the practice of Dr John Fotheringham of Motherwell, who, in November of last year, kindly drew my attention to it I visited the family and made the following notes

GROUP "B"

Mr B's father suffered from "intermittent squint" His daughter suffered from squint, and at about the age of 10 years underwent an operation for it at the Berkeley Street Eye Infirmary, Glasgow, with resulting cure It was there stated, according to Mrs B, that it was "hereditary squint" Mr B, aged 41, does not squint, kicked with the left foot when playing football, and is practically ambidextrous He wrote only with the left hand after the right was incapacitated through a war wound

Mr B's brother's daughter, aged 6 years, suffered from double convergent squint, for which she underwent operation

Mrs B, aged 39, has a left divergent squint In the spring of 1918 she had pleuropneumonia, with subsequent general thinning of hair, in April, 1923, pneumonia, with subsequent general thinning of hair again

Son, aged 13 years Right internal squint noticed at 14 months operation performed when about 10 years of age He wears convex glasses for squint At the age of 6 years he suffered from alopecia areata Kicks at football with the left foot rather than with the right

Daughter, aged 10 years Left convergent squint first noticed after fall on back of head at age of 2½ or 3 years Wears glasses for squint Suffered from alopecia areata at about the age of 3 years, contemporaneously with John (then aged about 6 years)

Daughter, aged 4½ years Has a pronounced left internal squint and a less marked right internal squint Slight tonsillar enlargement Small patch of alopecia areata, for which mother sought Dr J Fotheringham's advice At about 1 year of age had convulsions on two occasions, probably of gastro-intestinal origin

Daughter, aged 3 years and 3 months No squint No history of hair disease Slight tonsillar enlargement

Dr W Hislop Manson of the Glasgow Eye Infirmary examined five members of the family and reported as follows

1 Mrs B, aged 39 Strabismus divergens
2 Son, aged 13 Strabismus convergens (right), has been operated on
3 Daughter, aged 10 Strabismus convergens (left)
4 Daughter, aged 4½ Strabismus convergens (left)
5 Daughter, aged 3 No strabismus

Of the four squinters three had suffered at some time or other from alopecia areata The fourth—the mother—never had alopecia areata, but had suffered twice from post febrile alopecia

The other group came under my notice early in January of this year, at my clinic in the Glasgow Western Infirmary

GROUP "C"

Miss C, aged 29 Suffers from right convergent squint At age of 10 years suffered from "bald patches"—that is, alopecia areata, went to Ireland for a change and recovered Wears spectacles for squint and has done so since the age of 9, with an intermission of some years beginning about the age of 13

Mr C, aged 26 No squint He has the masculine type of baldness, which began in 1920 after demobilization He suffered from shell shock in 1919 His skin is of the seborrhoeic type

Mr C, aged 22 Right convergent squint He has suffered from intermittent alopecia areata, which first appeared at the age of 10, and lasted about one and a half years Relapse occurred at about 14 years of age, and hair has grown and come out annually ever since At present extensive alopecia areata exists There has always been an area of thin growth at the back of the head, where the alopecia areata is at present most pronounced

An aunt between 50 and 60 squints, but I failed to discover if she had ever suffered from bald patches

Dr W Hislop Manson reported as follows

1 Miss C, aged 29 Strabismus convergens (right)
2 Mr C, aged 26 No strabismus
3 Mr C, aged 22 Strabismus convergens (right)

Of the two squinters one suffers from alopecia areata, the other has suffered from it

I would add to the preceding reports of these three groups of familial cases of alopecia areata and strabismus one of a singularly suggestive isolated case of these two affections A medical friend who consulted me for alopecia areata gave me, a few weeks ago, the following report of his own case

Dr X, at the age of 14 years fell from a roof, fourteen feet from the ground on to a concrete floor He remained unconscious for one week and was stone blind for three months On recovery of sight left divergent squint was noticed, and about six months afterwards alopecia areata appeared in the upper occipital region At that time he was operated upon, as lateral diplopia existed After operation the diplopia became vertical, which was corrected with plain prisms, each 5 degrees with the left eye inverted—that is, base of prism of left eye uppermost The alopecia areata disappeared and remained absent until about eighteen months ago—that is, for about eighteen years With this relapse there were intense frontal headaches It was then discovered that the prisms were out of alignment This was corrected, and while the alopecia areata still exists the patch, which is situated above the left ear, has diminished in size Prior to the accident he stammered, and at the age of 15 or 16 (that is, subsequent to the accident) underwent a course of speech training to correct the defect It still occasionally recurs He has always kicked with the left foot but is not left handed

In reviewing the preceding cases, one or two points appear to warrant further deliberation Waiving for the moment the consideration of the association of alopecia areata and strabismus, I would briefly refer to the "Inman

hypothesis" or, in other words, the relation of squint to left-handedness and stammering. At the Ophthalmological Congress in London in May 1921, Dr Inman indicated that the association of these symptoms was linked with some emotional stress and that this was the factor of real importance. I am unaware that stammering occur in any of the patients I have mentioned, save in the case of Dr X, and this existed before the accident upon which strabismus followed. With respect to left-handedness, the father in Group "B" is practically ambidextrous and formerly when he played football used to kick with the left foot. His son aged 13 years a squinter, kicks preferably with the left foot when playing football. Dr X also kicks with the left foot, and I believe he has always done so.

Returning to the main thesis—the association of alopecia areata and strabismus—what effect has the correction of strabismus on the associated alopecia areata? It will be recalled that, in the isolated case of Dr X the alopecia areata cleared up after the optical defect had been corrected by operation and the wearing of suitable glasses: it reappeared after the prisms became out of alignment and diminished after their correction.

Heredity appears to play a not insignificant role in Groups "A" and "B". I understand that oculists do not recognize the existence of hereditary squint. It is however an arresting feature of Group "B" that the paternal grandfather a paternal aunt a paternal female cousin and the mother of the three strabismic children all squinted. It would almost appear as if this was heredity and of particularly potent origin in that it was determined by combined similar paternal and maternal influences. In Group "A" there did not exist bilineal influence but the mother squinted was neurotic suffered from alopecia areata and bore eight squinters six of whom suffered from alopecia areata and one had thin hair. Five of these children were very nervous one or them being a somnambulist.

While considering the question of heredity permit me to digress slightly from the cases of associated diseases to state that I have notes of two cases of alopecia areata unassociated, so far as I am aware, with strabismus where also the hereditary factor appears to be at work. One was that of a boy who, at the age of 15 years was brought by his mother to see me on April 24th 1919. She said that on the paternal side his grandmother a great-uncle and a great aunt became absolutely bald on the scalp and elsewhere and that another paternal great aunt had suffered from temporary partial baldness. The other case, that of a girl aged 8 years, whom I saw on September 6th 1921, had on the maternal side according to her mother's statement, a grandfather and aunt who had suffered from alopecia areata.

To return again to our main subject. A common area of origin of alopecia areata exists in several of the cases. In Group "A" four out of six cases began in the occipital region (mother's evidence for three of them). In Group "C" one patient has always had an area of thin growth at the back of the head, and it was there that alopecia areata was most pronounced when he came under my notice. In the case of Dr X alopecia areata first appeared in the occipital area. That is in 50 per cent of these cases the first manifestation was in the occipital region. All of these patients squinted. The visual centre is in the occipital lobe has this any special significance? In two cases—the case of Dr X and that of one of the children in Group "B"—strabismus developed after falls in the case of the child the blow was on the back of the head.

In dealing with these cases, care was taken by microscopic examination and cultural tests or cautious investigation and inquiry to eliminate dermatological diagnostic error while the eye examinations were made by an experienced ophthalmologist. Is there a causative factor in these cases common to the two conditions, strabismus and alopecia areata? It might be advanced that their association is merely coincidental. If so it is, especially in Group "A," and to a less degree in Group "B" co-incidence on an unusually grand scale.

Adverting to epidemic alopecia areata while maintaining a perfectly open mind as to the occurrence of epidemics presenting the macroscopic features of alopecia areata, I have yet after a long experience of skin practice in private hospital and school dermatological clinic to meet with one. I have only records—on two occasions it is memory holds good—suspected a contagious origin.

One of the theories of squint is that the equilibrium between the powers of convergence and accommodation is disturbed. The powers are dependent upon innervation. In my former communication I pointed out that, in Group "A" there was a possible maternal influence at work. Mrs A quinted, had suffered from alopecia areata of the whole scalp, and at one time suffered from "no feeling in the hand and head." She presented no physiognomical suggestion of congenital specific disease but I was unaware of any faulty obstetrical history. Five of her children one of whom was a somnambulist were very nervous, all quinted and had suffered from alopecia areata. In this group, with such evidence, I would be difficult to exclude the hair affection from the picture produced by nerve disturbance. Indeed it is strongly in favour of its inclusion as resulting from involvement of trophic nerve.

In the two additional groups of familial cases and the isolated case of Dr X there appears to be some further evidence in favour of a trophoneurotic origin of alopecia areata.*

THE TREATMENT OF LUPUS ERYTHEMATOSUS BY INUNCTION WITH BACTERIAL TOXINS

BY

WILLIAM DYSON OBE MD

Dermatologist Manchester Royal Infirmary Physician Manchester Hospital for Diseases of the Skin

THE etiology of lupus erythematosus is still undetermined therefore I thought that an attempt to elucidate this problem would be of interest to members of the Section.

Most dermatologists consider it to be a tuberculide some a toxi-tuberculide others a toxi-streptococcal manifestation, and others that it is due to toxins reaching the skin in the blood stream from various sources, and not necessarily to a specific toxin. All are agreed that vasomotor instability is a predisposing cause, and that traumatic atmospheric conditions such as sudden changes from cold to heat, exposure to bright sunlight etc may determine the appearance and localization of the lesions.

The opponents of the tuberculide theory argue that the histological appearances are not those of tuberculous lesions, that inoculation experiments have been inconclusive, that tubercle bacilli have not been demonstrated in the lesions, and, lastly, that injections of tuberculin do not produce either general or local reactions. Against the streptococcal theory is the fact that although in a certain number of cases a chronic septic focus can be found, and the removal of this with subsequent treatment by autogenous vaccines is sometimes successful in the majority of cases this procedure fails to have any influence on the course of the disease.

I do not at present propose to discuss the possibility of a non-specific toxaemia. It does not help us to come any nearer to the cause of the disease or, if the disease be due to more than one causative agent, to classify the type or case clinically.

I think we are all familiar with the local reaction which arises when a patch or lupus vulgaris is treated with tuberculin ointment about a year ago I thought it would be interesting to see if cases of lupus erythematosus would react in a similar manner, arguing that if the very tuberculous or toxi tuberculous lesions of the skin reactions should be obtained. I employed an ointment containing 5 per cent tuberculin (Old B V and Co) in vaseline. The ointment is rubbed into the lesions for a few days, and if no reaction is obtained in a week I place the case as giving a negative result. In a large number of cases a reaction was obtained. Usually about the third day the lesion

* All the patients also suffer from alopecia areata. I had a conference with the exception of Dr X who was not [illegible] distance.

became erythematous, swollen, and in some cases the inflammation was so acute as to cause an actual discharge of serum

Latterly, in cases which showed no reaction to human tuberculin, I have tested them with bovine tuberculin or a streptococcal ointment—10 per cent bovine (T P, Burroughs Wellcome and Co), or 5 per cent streptococcal vaccine, 1 c.cm =100 million (Parke, Davis), both in vaseline In thirty-five cases tested with human tuberculin twenty-one showed a positive reaction = 60 per cent I have tested four cases with bovine tuberculin, three of which had previously been negative to human tuberculin, while the fourth had been positive The first three were positive to bovine tuberculin, the fourth was negative

Lastly, I tested four cases with streptococcal ointment, all of which had previously been negative to human tuberculin, but one of which had shown a positive result to bovine tuberculin One case gave a positive result Thus by the application of these bacterial toxins locally I have obtained reactions in twenty-five out of thirty-five cases =71 5 per cent Of the ten cases in which I obtained no reaction most of them were tested with human tuberculin only, and I have no doubt that if they had also been tested with bovine tuberculin and streptococcal ointment I should have obtained a still higher percentage of positive results

The reaction appears to be specific—that is, those cases which react to human tuberculin do not react to bovine or streptococci, and vice versa The reaction is local, only occurring in the patches to which the ointment has been applied, while the other lesions remain unchanged

Is it possible to make a clinical division between those cases which will react to the specific toxins?

All the cases with one exception which reacted to tuberculin, human or bovine, were chronic in character, mostly of the discoid type showing well marked atrophy, the one exception was of the superficial erythematous type In this patient the lupus erythematosus was associated with well marked tuberculous cervical adenitis

Of the three cases reacting to bovine tuberculin, two were of the nodular type with well marked atrophy, the third was an extensive case affecting practically the whole face, with well marked follicular plugging and pitted atrophy The one case giving a reaction with streptococcal vaccine was of the acute superficial erythematous type The only other acute case I have had the opportunity of examining since I commenced this investigation was a very acute case which looked as though it might become generalized, the face, chest, hands, and feet being all affected, she, however, developed an irregular temperature accompanied with the physical signs of lobular pneumonia She was tested with human tuberculin with negative results It is suggestive that the only case which reacted to streptococci was of the acute superficial erythematous type

Conclusions

If lupus erythematosus is a toxi-dermatitis, then we are justified in assuming that the toxin is carried from the infected focus by the blood stream and is fluid in character, therefore one would not expect any special localization We are all familiar with the fact that the lesions of lupus erythematosus appear more especially in regions which are subject to vasomotor disturbances, therefore it seems to me probable that the inflammatory changes are the results of the local action of bacteria, the localization of the lesions being determined by a condition of capillary instability

If these results are due to a local sensitization to specific toxins I think we are justified in assuming that the toxin producing the reaction is the same as that which produced the local sensitization of the lesion, and that the causative agent producing the lesion is the same as that to which it reacts

In thirty-five cases I have shown that over 70 per cent react to either human or bovine tuberculin, and that 2 8 per cent react to streptococcal vaccine, also that the clinical type of the cases reacting to tuberculin is different from those reacting to streptococcal vaccine The recent work of Dr Jorgen Schaumann of Stockholm may possibly give the explanation why the histological appearances in lupus erythematosus differ from those of other tuberculous lesions of the skin

Since completing this paper I have tested the apparently normal skin of a patient suffering from lupus erythematosus in whom I had obtained a reaction with bovine tuberculin After four daily applications the skin showed a well marked reaction, pointing to the fact that the whole skin was sensitized to a specific toxin This raises the question whether the sensitization is secondary to the lupus erythematosus or the lupus erythematosus is the result of sensitization from another source

I hope to make a supplementary communication on this subject in the near future

Memoranda:

MEDICAL, SURGICAL, OBSTETRICAL.

FATAL HAEMORRHAGE AFTER TRACHEOTOMY

A MALE child, aged 1 year and 9 months, was admitted to the Shieldhall Fever Hospital, Glasgow, on June 12th, suffering from faucial and laryngeal diphtheria Respiratory obstruction was very marked, and tracheotomy was performed on the following day The trachea was entered below the isthmus of the thyroid, and a considerable quantity of diphtheritic membrane was evacuated Some surgical emphysema of the neck and chest followed the operation, but this soon subsided The tracheotomy tube was removed forty-eight hours after the operation The process of healing of the wound was perhaps a little slower than usual, but the general condition of the patient remained satisfactory and everything seemed to point to a good result, when, on June 23rd, a sudden and *fatal* haemorrhage took place The bleeding was so profuse, and death supervened so quickly, that it was impossible to say at the time where it had come from

At the *post-mortem* examination the trachea, larynx, the upper part of the oesophagus, the arch of the aorta, and the great vessels passing up in front of the trachea were removed in one mass On opening the trachea a hole a quarter of an inch in diameter, evidently the result of ulceration, was found on the anterior aspect, about an inch below the tracheotomy wound This ulcerative process had continued through the entire thickness of the tracheal wall and through the wall of the overlying left common carotid artery, thereby causing the haemorrhage

From the position of this lesion it looked as though it had been started by pressure of the lower end of the tracheotomy tube while it remained *in situ* The mucous membrane of the congested, but all signs of diphtheria

Glasgow. ROBERT J PETERS

PICRIC ACID DERMATITIS

IN his classic textbook of pharmacology (1900) Professor Cushny has written

> "Picric acid is an irritant to the skin and mucous membranes, and in large doses causes vomiting and often anuria and strangury Violent convulsions occur sometimes, in other cases collapse An ointment containing it has been applied in some forms of eczema, but it gave rise to poisoning in one of the few cases in which it was employed"

The toxicology of this antiseptic (of the aromatic nitro benzol series) was therefore stressed twenty-four years ago, but its use to-day appears, if my information be correct, to be pretty general both in hospital and private practice

It would be interesting to know who first proposed the use of this gaily coloured poison as a dressing, but I sincerely hope it was not a dermatologist Its therapeutic applications have at any rate been widely promulgated in British medical literature *A Manual of Surgery* (Rose and Carless, p 117) advises "that a solution of picric acid (gr 5 ad oz 1) be applied to the burnt surface which may be left *in situ* for several days," and the excellent

modern *Index of Treatment* by various writers (p 156) directs that "lint soaked in a *saturated* solution should be kept applied to the part for some time"

The supposed "pickling" of the tissues produced by picric acid may have given rise to the belief that it is analgesic, but in a case of severe scald, complicated by picric acid dermatitis, which I saw as recently as August 24th, three days after the drug had been applied, the patient, a man of 32, assured me that the pain had greatly increased and continued from the moment of its application

This is scarcely the place to emphasize its value in this respect, but I have no doubt that 'ambrine" is by far the most soothing preparation, both immediately and for repeated dressings (as it does not adhere to moist wound surfaces) that we possess

Whether picric acid is an efficient means of securing asepsis prior to major surgical procedures must be left to the judgement of the surgeons and bacteriologists but that it may be a cause of severe suffering in a predisposed person is illustrated by the following case

Mrs X has always had a delicate skin so that blisters have followed a single application of tincture of iodine (*B I*) When recently admitted for carcinoma mammae she forgot to tell the ward sister of her idiosyncrasy and the whole side of the chest and axilla was freely painted with a weak solution of picric acid Even before she went to the theatre she experienced burning and itching and on the following day there was a very severe vesicular eruption of the whole area so that the pain of the operation was as nothing compared with that due to the skin affection It is of interest to record that the symptoms continued to spread until the whole upper trunk and arms to the wrists became involved in a severe papulo vesicular dermatitis hardly distinguishable from a case of acute eczema

That such a notable reaction is a rare occurrence I am prepared to admit, but I have seen other cases, and there are occasional examples of it in the literature In my opinion the evidence is sufficient to justify an earnest plea for the abolition in therapeutics and surgery of a dangerous chemical, for which there are so many less toxic and equally efficient substitutes

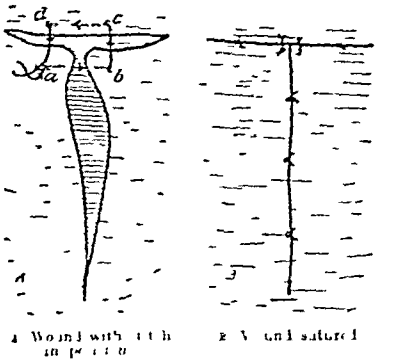
London W 1. HENRY C SEMON, M D, M R C P

MELAENA NEONATORUM TREATED BY INJECTIONS OF PATERNAL BLOOD RECOVERY

THIS year I have read in the BRITISH MEDICAL JOURNAL of two cases of melaena neonatorum treated by injections of paternal blood so that it may not be out of place to record the following case, which differs somewhat from those reported

A primipara who had been in labour for about sixteen hours was delivered of a healthy female child weighing 8 lb at 9 p m on May 3rd Delivery was normal no instruments were used but an injection of pituitrin (1/2 c cm) was given followed by another injection of the same amount after an interval of three hours when the head was on the perineum The following day (May 4th) the child passed *meconium* and was put to the breast every three hours During the night of the third day she did not sleep well and was restless until 5 a m *meconium* was passed at 7.30 At 10 15 she vomited a large amount of bright red blood and again at 10.30 When I saw her she was cold and clammy and the pulse hardly perceptible I sent for the father and while awaiting his arrival injected 2 oz of normal saline into one buttock and gave iced sterilized water in sips by the mouth the child was kept warm by hot water bottles

At 12.30 p m 5 c cm of the father's blood were withdrawn from the median basilic vein and injected deeply into the left buttock Immediately afterwards the child fell into a peaceful sleep the colour improved and she became warm At 7 15 p m she again became restless and there was a copious discharge of bright red blood from the bowel At 8 o clock 10 c cm of the father's blood were injected the child again became peaceful but vomited (coffee ground) at 10 p m Sips of albumin water were given and the child slept well Small quantities of blood were passed from the bowel until the end of the fourth day after which the motions were tarry and remained so until the end of the sixth day they became normal on the ninth day The child was given the breast again on the morning of the fifth day



The child's weight on the ninth day was 7 lb 2 oz on the sixteenth day 7 lb 4 oz on the twentieth day 7 lb 6 oz on the twenty third day 7 lb 8 oz and on the twenty-seventh day 7 lb 10 oz The child remained well except for some flatulence and slight looseness of the bowels these soon disappeared

Some time later I learned that the father had at one time been looked upon as a "bleeder", a few months previous to the confinement I performed a minor operation on him and found then no signs of excessive bleeding

Milngavie R J LESLIE FRASER M B, Ch B

"T" SHAPED WOUNDS

THE following procedure was found useful by me when resident casualty officer at the General Infirmary Leeds It is suggested as a ready and simple method of dealing with the wound resulting from the suturing of a divided tendon

A Wound with stitch in position B With sutures tied

A "T" shaped wound is caused by the original cut and the incision necessary in the search for the proximal end After securing the two ends of the tendon any difficulty in the coaptation of the skin edges is overcome by the use of the stitch here described The needle entering at *a*, passes through and emerges at *b* then passes superficially to *c* where it re enters the skin to appear at *d* Sufficient tension is now used to bring the three edges into accurate apposition, when any further sutures necessary are easily inserted

Reports of Societies.

TREATMENT OF UTERINE FIBROIDS

AT a meeting of the Brighton and Sussex Medico-Chirurgical Society, held on September 9th, when Dr E I MAYNARD (President) was in the chair, Mrs LILIAS JEFFRIES, M D, read a paper on the treatment of uterine fibroids

After giving in detail the history of a typical case the symptoms and treatment were shortly discussed The physique of patients with fibroids was often muscular, approaching the masculine type Common symptoms were (1) Menorrhagia beginning early, and often with dysmenorrhoea increasing metrorrhagia and haemorrhage Leucorrhoea, sometimes offensive, preceded intermenstrual haemorrhage (2) Sterility, 30 per cent of fibroid uteri had never been pregnant, sterility followed by repeated abortions was more common If diagnosis could be made, myomectomy was the correct treatment (3) Backache was common, also tenderness when congestion was marked, otherwise it was a symptom of degeneration or infection Pain due to pressure on the sacral nerves was very common, the patient believing she had sciatica, lumbago, or neuritis (4) Dysmenorrhoea due to congestion or efforts at extrusion (5) Bladder symptoms due to pressure on urethra or bladder Frequency of micturition was very common and distension due to retention and cystitis followed (6) Dyspareunia, due to mechanical obstruction or tenderness of tumour (7) Rectal symptoms, due to pressure, developed later

The treatment was as follows (1) Cases without symptoms must be watched, but needed no treatment (2) Medical treatment was palliative only, and seldom sufficient eventually The menopause seldom cured fibroids that had shown symptoms, but atrophy of tumours might occur (3) Curettage was sometimes sufficient, it was more useful for diagnosis (4) Myomectomy was the ideal treatment when practicable, especially to cure sterility, and in patients who could not face the loss of the function (5) X rays might be used by the older Freiburg method the Erlangen method, or the Beclere method, or radium treatment given The treatment was applicable to tumours under four months' pregnancy size if the diagnosis of simple fibroids was certain Permanent amenorrhoea need not result (6) Hysterectomy was the commonest end-treatment in 65 per cent of all cases The results were satisfactory, it ensured complete removal of the disease, with no possibility of recurrence

Reviews.

SURGICAL ESSAYS

ALL who have come into contact with DR JOHN B DEAVER'S lively personality will turn with interest and expectation to his new volume of essays—*Excursions into Surgical Subjects*.[1] Two years ago Dr Deaver went out to the West to deliver a series of lectures in the Extensions Course of the University of Washington at Seattle. Seattle is a typical example of the very rapidly grown and prosperous city, such as the currents of American civilization alone could have produced. It is pre-eminently a business man's town, engrossed in getting on and making good. Its university has no medical school, and these lectures were in the nature of a post-graduate clinic.

The essays on specific surgical subjects (peptic ulcer, jaundice, diseases of the bile passages) are necessarily comprehensive and do not aim at the elucidation of any small point. Rather are they the wide generalizations, backed by timely statistics, of one who has been a most busy and successful practitioner of surgery. Dr Deaver has always been a practical man, and has imbued his students with the need for self-reliance. In this respect he resembles, perhaps, many teachers of the British school. He is not a laboratory man, but, common sense being his watchword, he has a very lively appreciation of the information which the laboratory can give. Very justly he mistrusts too early specialization, and in one of these essays has some wise things to say in favour of part-time as against whole-time professorships. Dr Deaver is able to say of himself that his clinical teaching has always had the first and paramount consideration in the day's work. It is curious how many authors manage to emasculate their style when they commit themselves to paper. Dr Deaver's real medium is the spoken word, by the bedside and in the operating theatre. There he has been unique, forcing his lessons home by a crescendo of questioning, calling up vivid pictures before the eyes of his hearers. Little sign of this vivid personality appears in these essays. Needless to say, they are dogmatic and sound, but they might well have originated from a more tranquil source. He has been assisted on the pathological side of the problems elucidated by DR STANLEY REIMANN (also of the Lankenau Hospital, Philadelphia), whose name appears with Dr Deaver's on the title-page.

CARDIOLOGY

DR NEUHOF tells us that the object at which he has aimed in writing *The Heart: Its Physiology, Pathology, and Clinical Aspects*[2] is to present in one volume the more recent contributions to cardiology and to correlate them with the larger clinical and practical aspects of the subject. The book is intended for practitioners and students, as well as for those specially interested in cardio-vascular diseases.

The subject-matter is discussed in a very systematic manner. Chapters are devoted to the embryology, microscopic anatomy, physiology, and pathology of the heart. Thereafter graphic and electrometric methods of investigation are discussed in considerable detail. The author has attempted to make the facts clear for the practitioner who has not been trained in this branch of the subject, but the main broad issues are often confused by a multiplicity of detail and of illustrations.

We have difficulty in agreeing with the author's interpretation of some of the records printed in the text, and many of them will not be easily understood by anyone who is not already thoroughly familiar with the polygraph or electrocardiograph. The explanation of auricular fibrillation is somewhat confused, for example, the author sums up his subject in the following sentence: "Concisely stated, therefore, auricular fibrillation is essentially due to any influence—toxic, nutritional, reflex, etc.—which breaks up the simple, normal, single, 'circus' wave starting from the pacemaker by interfering with and blocking the propagation of the wave." A chapter deals with the examination of the heart by x rays, and numerous orthodiascopic tracings of the heart are given. Thereafter the various diseases of the heart are treated seriatim, and clinical records of 108 cases of cardio-vascular disease are provided.

There are many advantages in having the various aspects of heart disease combined in the one volume, though there has been a tendency in the past for much of the newer work to be kept in separate textbooks, this tendency is passing away, but it is difficult to combine these two aspects of the subject and make the result suitable at once for the general practitioner and for the specialist. For the former the book must be written in an easy style, and yet it must be sufficiently accurate to enable him to obtain a grasp of the principles. For the latter the matter must be accurate, particularly in detail. Our feeling is that the author of this volume has not made the subject sufficiently simple for the practitioner, nor yet sufficiently accurate in detail to make the book of real value to the specialist.

DISEASES OF THE NOSE, THROAT, AND EAR

THE late DR W G PORTER, who fell in the great war, was the author of a textbook on *Diseases of the Nose, Throat, and Ear*, which commanded such success that about a year ago a third edition, produced under the direction of his colleagues, was exhausted. The present work,[3] still based on the original plan, is dedicated to the memory of Dr Porter by DR LOGAN TURNER and his colleagues engaged in the practice and teaching of otology and laryngology in Edinburgh. Dr Porter succeeded in writing a small book, embracing diseases of the ear, nose, and throat, sufficiently comprehensive for the senior or post-graduate student, and this clearly met the want for a book of reasonable size including the three subjects.

The new volume, under the editorship of Dr Logan Turner, has been expanded into a kind of small system, but it still remains of moderate size and is intended to meet the same requirements as the previous book, though more fully. The first section, on the nose, is the joint production of Dr Logan Turner and Mr W T Gardiner. It is thorough and complete, and, taken along with the next section, on the accessory sinuses, by Dr Logan Turner alone, gives an account of the anatomy, pathology, and surgery of these regions, which compares favourably with that in any of the larger standard books.

The section on the pharynx and naso-pharynx has been written by Mr Douglas Guthrie, and that on the larynx by Mr J D Lithgow. The former, though lacking in nothing essential, is perhaps a little compressed in relation to the scope of the rest of the book, though on the whole the editor has maintained the balance between the various parts admirably. The suggestion might be put forward, however, that these sections might be brought in some way a little more into relation with general medicine.

The fifth section, on peroral endoscopy, by Mr Ewart Martin, provides an account of the direct examination of the larynx, trachea, bronchi, and oesophagus, which gives the reader an excellent idea of what can be accomplished in this way, knowledge which should be possessed by every practitioner. There is rightly no elaborate description of technique, which is beyond the scope of the book.

The last section, on the diseases of the ear, is the work of a master, for in the space of about a hundred and fifty pages Dr J S Fraser has given a most remarkably complete and lucid account. He has not shied at the perplexities of nystagmus and the tests of labyrinthine function, and it would be difficult to find anywhere a more satisfactory concise exposition of this difficult subject.

The editor is to be congratulated on the skill with which these several articles have been welded into one treatise, and on his judgement on the method of expansion of the

[2] *The Heart: Its Physiology, Pathology, and Clinical Aspects*. By Selian Neuhof, B.S., M.D. Philadelphia: P. Blakiston's Son and Co. London: Stanley Phillips. 1925. (Medium 8vo, pp. xii + 701, 303 illustrations. 10 dollars.)

[3] *Diseases of the Nose, Throat, and Ear for Practitioners and Students*. Edited by W. Logan Turner, M.D., F.R.C.S.Edin. Bristol: John Wright and Sons, Ltd. London: Simpkin Marshall, Hamilton, Kent and Co., Ltd. 1924. (Demy 8vo, pp. xxii + 413, 217 figures, 12 plates. 20s. net.)

original There is a profusion of excellent illustrations which enhance the value of the text, though the coloured plates, as before, are more dazzling than faithful to the tones either of sunlight or of artificial illumination The book as a whole is singularly free from any bias towards the teachings or methods of any particular school, and has been written with such care that only one minor inaccuracy has revealed itself In describing the treatment of facial paralysis the writer evidently intends to refer to the hypoglossal nerve and not to the lingual The new book will well maintain the position which was established by the work of Dr Porter

THE EVOLUTION OF MAN

By assembling in book form three valuable addresses upon the history of man's evolution, Professor ELLIOT SMITH has furnished all interested in this subject with a clear and authoritative statement of the important general principles which have been neglected in most of the larger textbooks dealing with man's pedigree

The volume is entitled *The Evolution of Man*,[1] and the three addresses are those delivered to the British Association, to the British Academy, and at the Royal Institution, and our present knowledge concerning the position of the human family in the order of primates is graphically summarized in a Foreword The reader readily acquires a clear conception of the sequence of events leading to the appearance of *Homo sapiens*, but perhaps the most admirable and valuable feature of the book is the lucid way in which the significant fundamental factors influencing the emergence of intelligence are presented Many common fallacious ideas will be dispelled by a careful perusal of this contribution to our knowledge of the primates and man The facts are marshalled throughout in such a manner that the general reader might almost interpret them for himself, and the main stages in the history of man stand out in such bold relief that the book may be considered an ideal introduction to this fascinating subject No one can fail to appreciate how important in the evolution of man has been the long persistence of primitive traits which permit a greater degree of adaptability, and how disastrous early specialization has proved to any class of animal Students of comparative anatomy have been long aware of this truth, and it is to be hoped that Professor Elliot Smith's emphatic statements upon the subject may enlighten others who still seem unable to appreciate its importance After showing the vital influences of the "arboreal apprenticeship" and the consequent replacement of smell by sight as the dominant sense, the author vividly portrays the evolution of stereoscopic vision and sketches the far reaching effects of its development Readers who have not had the advantage of following the recent investigations of Professor Elliot Smith and his co-workers upon the evolution of stereoscopic vision will welcome greatly this concise section of the book, which presents the most significant results of these researches and their bearing upon the history of man

The volume is clearly and efficiently illustrated and provided with a good index, and readers will await with eager anticipation the appearance of a fuller exposition in the form of a textbook of the evolution of man, which the author promises in the preface

RHUS DERMATITIS

Of all the cutaneous eruptions caused accidentally by plant substances, that produced by the different species of rhus (poison ivy) is probably the most common in America Few people in this country, it may be assumed, are acquainted with the plant or its effects on the human organism, but those who would gain a knowledge of the subject will find JAMES B MCNAIR's book on *Rhus Dermatitis*, not only very interesting, but also a model of its kind It contains a very full account of the subject, so far as published information is concerned, and records the author's own researches, which constitute a substantial addition to our knowledge The plant and its effects were succinctly described by Captain John Smith in 1609

> The poysonous weed being in shape but little different from our English yvie but being touched causeth redness itchinge and lastly blisters the which how soever after a while the partie endure of themselves without further harme, yet be alike for the time they are somewhat painfull, and in a part dangerous it hath gotten itselfe an ill name although questionlesse of noe verie ill nature

The affection has, therefore, to be distinguished from dermatoses caused by other substances, and also from idiopathic eczema The poison is, however, absorbed from the skin to a variable extent, and at times from the intestine, in cases where the plant has been eaten with a view to producing immunity from its effects In such cases the disease wears a somewhat more serious aspect than Captain Smith would have had us believe A definite febrile course results, lasting for about a week, there is a rise in the blood pressure and congestion of the lungs and bronchial tubes, with cough, expectoration, and diffuse congestion of the conjunctivae, tinnitus, and disturbances of vision, epistaxis, sore throat, and sometimes delirium A fatal termination has been recorded in three cases only a boy 6 years old, who died within three weeks, a woman aged 69, who died after two months of severe suffering, and a man who had slept in a wood in which rhus was growing That the disease is refractory to treatment is perhaps best evidenced by the list the author gives of the remedies that have from time to time been recommended they number two hundred and fifty Until further opportunity for experimentation and clinical observation occurs the author recommends Barthe de Sandifort's paraffin treatment of burns as a tentative method for external treatment or, for those who do not care to apply the paraffin method, bathing the entire body with dilute aqueous ferric chloride, this, if efficiently done, will neutralize any poison that has not already penetrated the skin The book contains numerous descriptions or cases of rhus dermatitis, and the following may be cited as an example of the severer forms

> A man in cleaning up his grounds had handled the plant which grew on the place in great abundance A few days later his hands were covered with vesicles and his face and genitals badly swollen The next day the eruption appeared on the arms thighs and abdomen and continued to spread for several days The face and ears were greatly swollen congested and dripping with fluid, the trunk was covered with large patches of papules and vesicles and by most excoriations the genitals were enormously distended by oedema and the scrotum running with serum the arms and legs were in a similar condition The patient suffered tortures from the severe itching and sleep without powerful anodynes was impossible for several nights in succession After the seventh or eighth day the skin rapidly returned to its natural condition

A very extensive bibliography is appended, running into seventy seven pages The work is very thoroughly done, and those parts of it which deal with the subject from a pharmacological standpoint are of particular interest

THE RELATION OF THE SEXES

The Relation of the Sexes[2] is one of the series of reports drawn up for submission to the Conference on Christian Politics, Economics, and Citizenship held in Birmingham last April Among those responsible for the production of this report were the following members of the medical profession Lady Barrett, Mrs Rowntree Gillett, Dr A C E Gray and Dr J A Hadfield The report is divided into four principal chapters, entitled 'Sex," "Love and Purity," "The Revolt against the Christian Ideal" and "Marriage" The communal and personal aspects of such subjects as birth control, prostitution, venereal disease, and divorce are discussed with refreshingly refined restraint There is one note in the report which will antagonize those who strongly favour self-disinfection as a means of preventing the spread of venereal disease On page 113 it is stated that the Church must fight any form of State provision of facilities for self-disinfection

It is mentioned in the foreword that on several of the subjects discussed the members were seriously divided It could hardly be otherwise in dealing with such questions,

[1] *The Evolution of Man* Essays by G Elliot Smith M A M D Litt D D Sc F R C P F R S London H Milford Oxford University Press 1924 (Demy 8vo pp vi + 153 19 figures 8s 6d net)

but the spirit animating the whole report is wisely tolerant and definitely educative in its aim It does not claim to represent a final solution of the problems with which it is concerned

THE WORLD'S CHILDREN

FROM official sources Mr EDWARD FULLER has compiled an *International Year Book of Child Care and Protection*,[7] which is published by the Save the Children Fund As Mr Percy Alden says in his introduction to the volume, "the last fifty years have witnessed an immense improvement in the treatment and cure of the child the time seemed ripe for a Year Book of the Child" In general, information is grouped for 350 sovereign states, colonies, and dependencies under various headings, giving brief information on population and accounts of the marriage and divorce laws, child welfare in its quasi-medical sense, and education, employment, delinquency, and legislation as they affect the child Where voluntary societies exist these are listed for each country The whole of the information is summarized in a series of tables, and an index facilitates reference

So far as it has been possible to check the information, the compiler seems to have done his work well and the book will be useful for reference As it seems likely that new editions will appear each year, one or two minor details may, perhaps, be criticized There is no mention of the Junior Red Cross in the section on the United Kingdom, although this society is doing good work in a small way, nor is the Ecole de Puericulture included in the section on France, although this new institution is playing an important part in training child welfare workers Advertisements have crept in between the introduction and the body of the book and again at the end before the tables, and would be better grouped all together The excellent idea of a sort of international "Who's Who" has been incorporated, but this falls short of being complete, and in some respects is out of date

Apart from these minor points, however, the book gives a faithful picture of the 'life and health the education and nurture of the world's children,' and the compiler is to be congratulated on producing such a wealth of information

NOTES ON BOOKS

THE sixth edition of DR HERBERT E CUFF'S *Practical Nursing*[8] has been revised and enlarged by DR W T GORDON PUGH, who collaborated with him in the last editions Not only has the book been increased by nearly two hundred pages, but it has undergone considerable revision, so that nearly three quarters of it is new The work, which formerly consisted only of three parts, devoted to general nursing, medical nursing, and surgical nursing respectively, is now divided into seven parts, preceded by an introduction on the history and ethics of nursing The new parts deal with hygiene and dietetics, bacteriology and immunity, fevers and fever nursing, and gynaecology and midwifery In addition to numerous illustrations several new chapters have been added, such as those on pharmacology and therapeutics, the child in health and disease, and massage, medical exercises, and medical electricity The present edition has been well brought up to date in every respect and will prove valuable to all branches of the nursing profession both in their daily work and in their preparation for examinations

COLONEL MILLNER'S little book on *The Irish Setter*[9] might have been of more value had it been more coherent and its statements as to the origin and breeding of these dogs less problematical The author seems to take too much for granted and seldom gives any reasons and still seldomer any proof of his statements The book contains some 78 pages, and we have hardly a word of the red setter of to day until we reach page 43 The old red and white setter of Ireland, which is that dwelt on in the early part of the work, was, the author admits, a separate variety, and is now probably extinct The author states (pp 44, 45) that the marvellous deep rich red colour of the present type of Irish setter comes from the spaniel, but this colour is exceedingly hard to get in the spaniel of to day, or indeed in any other breed of dog Again, the author (p 45) writes of "semi wild ancestors" without sufficient justification The illustrations are poor and do not give any true idea of the beauty of the Irish setter The book will give the reader little flesh information of a reliable kind The English setter is quite as enduring a dog as his Irish brother, and, unlike him, does not require breaking anew at the beginning of each season

The Handbook of Pharmacology[10] compiled by DR B N GHOSH is intended for the use of Indian students preparing for examination in materia medica In the first part the subjects of pharmacy and dispensing are fully treated, and the art of prescribing is well set forth Drugs are classified by their effects on the various organs of the body The book seems well adapted to fulfil its purpose, and though very condensed appears to include all the information on the subject which a student can require The author dedicates the book to the memory of his father, the late DR Rakhaldas Ghosh, who died in 1902, just after completing a *Treatise on Materia Medica and Therapeutics*, which was seen through the press, after his death, by the late SIR Pardey Lukis, then principal of the Calcutta Medical College The style of the book before us is clear, and the type and general get up is good, the book is of a size handy for the pocket, we have noticed very few misprints

The Pharmacists' Botany[11] is the title of a book by DR GEORGE B RIGG of Washington, U S A On the jacket the information is given that "the author has spent fourteen years actively engaged in the problem [*sic*] of teaching pharmacy botany—eliminating non essentials so often stressed—and seeking ever more practical means of presenting the subject to the best advantage with the least waste This book is the result" Such a statement hardly disguises the sentiment that learning is waste beyond what is needed for a limited purpose Such was not the creed of earlier pharmacists, they were wont to regard botany as a branch of biology to be studied as a science To them the term "pharmacists' botany" would have sounded strange DR Rigg's book leads the reader from the primary elements of the subject to the most recent discoveries in botany at a pace which seems to deny him as a student all opportunity of thought Such intensive treatment can only lead to knowledge without understanding It is true that the text is accurate in what it describes, and for this merit it may be read with profit by students desirous of refreshing their memories of past study Had we been asked to bestow a title on the book we should have chosen "Botanical Notes for Pharmacists", so regarded it is a very helpful volume

The eighth number of the *Bulletin of the Ayer Clinical Laboratory of the Pennsylvania Hospital*[12] contains seven papers, three of which—namely, DR E G DILLON'S report of two cases showing glycosuria following obstruction of the pancreatic ducts, in one by pancreatic calculi, in the other by carcinoma, DR SYDNEY L WRIGHT'S observations on the loss of reducing substances in blood and blood filtrates, and the same author's discussion of the determination of sugar in small quantities of blood—deal with closely allied subjects In their interesting paper on nitrituria in infections of the urinary tract DRS J R PAUL and W E CHAPIN conclude that the presence of nitrites in recently passed urine is most commonly due to nitrate reducing bacteria in the urinary tract, but that negative results are not of any significance, they find that the percentage of positive tests in known urinary infections can be raised by giving potassium nitrate within four to ten hours of carrying out the test DR T. McKEAN DOWNS reports a case of acute mastoid inflammation in which the mastoid cells were in an abnormal situation A case of congenital haemolytic jaundice is commented on by DRS G W MORRIS and F N MACMILLAN, who state that in 1921 splenectomy had been performed in 93 cases, with a mortality of about 5 per cent DR J R PAUL'S account of the Museum of the Pennsylvania Hospital is illustrated by microscopic sections of specimens which had long been in spirit, and provides some historical information about one of the oldest museums in America

PREPARATIONS AND APPLIANCES

Canadian Pasteurized Cheese

We have received a sample of Kraft Canadian pasteurized cheese. This product is made by a new process the cheese is chipped into small fragments and cured cheese is then blended with fresh cheese By means of this blend a standardized product is obtained The packing of the cheese represents an interesting development in the handling of food substances The pulverized cheese is cautiously heated and then weighed out in exact quantities and transferred hot into boxes lined with tinfoil The cover of the box when nailed on acts as a press the box itself being the mould for the cheese The cheese is thus delivered to the consumer in a package which protects it against all extraneous dirt and the mode of preparation is such as to ensure the minimum of handling The product is of good appearance and has a pleasant taste

A Knife Sharpener

An ingenious instrument has been brought to our notice called sphaera medico It is a knife sharpener of the finer sort The principle is the same as that commonly employed for the quick sharpening of dinner knives particularly those of rustless steel where hard steel wheels are fixed in a suitable frame and the knife edge is drawn along the cleft formed between the two overlapping wheel edges In the sphaera medico there is a double-ended forceps the blades are joined in the mid length and the free ends are cup-shaped into each of the four cups is inserted a ball so that the balls face and press against each other a pair at each end One pair of balls is turned from Arkan as oilstone the other pair is of steel For the purpose of putting a good edge on a scalpel the knife is held on the table so that the blade is back downwards and projects from the table edge Then the instrument is held like a pair of forceps the blades firmly together and the knife edge is stroked from heel to point first with the oilstone balls and then with the steel balls. The instrument must be held firmly otherwise the balls slip down over the edge on to the blade and no work is done Also the operator's fingers must be kept clear of the knife We have tried the sharpener on an ordinary scalpel which had been roughly sharpened on a coarse stone the edge was rough and caught the skin. After a dozen strokes first with the oilstone balls and another dozen with the steel ball the edge was smooth and keen The instrument may be boiled but the balls must occasionally be greased with vaseline It is a useful and simple device The agent is B Coryn 67 Holborn Viaduct House London E C.1.

Photographic Desensitizer

The use of a desensitizer in photography is to allow development to be carried out by white light Luppo-Cramer found various dyes of the safranin group to be the best desensitizers in developing x-ray negatives A B MacLean has recently experimented with Grubler's safranin (soluble)[1] The film is treated to a bath of safranin 1 in 5 000 well rinsed and then put into the developing tank It was found that films could be developed under white light if certain conditions were fulfilled With correctly exposed negatives any advantage gained is so slight as to be negligible but with overexposed films better results are obtained than by the usual method It is no suitable for underexposed negatives. Messrs Burroughs Wellcome and Co have put on the market a desensitizer in compressed form A leaflet issued with the preparation mentions the precautions which should be taken The composition of the desensitizer is not stated

Jarring Doors

A door pad has recently been invented for use in hospitals nursing homes and children's nurseries by its use the door can be kept ajar A rubber pad is attached to the inner and outer handles of the door and is stretched over the latch preventing any banging or rattling It may be obtained from Mrs H. E S Rowland The Homestead Crick near Rugby

DRUG TRAFFIC AND THE LEAGUE OF NATIONS

[FROM OUR CORRESPONDENT AT GENEVA]

THE traffic in opium and other dangerous drugs has again been the subject of considerable discussion at Geneva The Assembly of the League of Nations was, as mentioned in our last issue, preceded by the meeting in August of the Advisory Committee of the League charged with this subject The report of the committee showed that during 1923 six countries ratified the Opium Convention, and three signed the protocol putting the Convention into force In Switzerland, which is one of the most important of the manufacturing countries, a law agreeing to ratification was passed in June by the Council of States Ten more countries have accepted and put into force the import certificate system In order to facilitate the application of this system the committee has decided that it would be legitimate for a diplomatic or consular officer of the importing country stationed in the exporting country to issue these certificates on telegraphic instructions from his Government; this decision meets several objections which have been raised against the certificate system The situation in China was considered by the committee to be very grave, the cultivation of opium in many provinces has increased to an enormous extent An inquiry undertaken by the Chinese Government has yielded no satisfactory results, and the enormous production of opium in China is now hampering the control of the traffic throughout the world The Advisory Committee recommended that Powers having extra-territorial rights in China should make regulations, the breach of which should be punishable by adequate penalties, to control the carrying out by their nationals in China of any trade in the drugs to which the appropriate chapter of the Convention applies

Immediately on the assembly of the League this month the recommendations of the Advisory Committee came before the Fifth Committee which deals with social questions, and were adopted and reported to the Assembly The report on the subject was made by Mlle Bonnevie (Norway), who referred to the two national conferences on opium the Council of the League had decided to call in Geneva next November—the first a conference to deal especially with the Far Eastern territories, and the second a more general conference to which all members of the League and parties to the Convent on of 1912 are to be invited Investigations are to be instituted by the League with regard to the production and use of Indian hemp, and Sir Mahommed Rafique (India) said that the Government of India had already taken the matter up, but that some time must elapse before action by local governments could be co-ordinated

In the ensuing discussion Mr Arthur Henderson said that the experience of the British Government, which he understood was confirmed by that of other Governments, showed that illicit traffic continued to be carried on through many different channels and on a large scale, and that closer control and more international co-operation would be necessary if the objects of the Hague Convention were to be attained M Sarraut (France) said that the French law of 1916 completed by the law of July, 1921, established very complete control over the trade in opium It extended both to persons and building in which drugs were manufactured Very frequent surprise inspections were made Mr Chao-hsin Chu (China) stubbornly defended his country He said that the great evil to-day was the Western consumption of cocaine, morphine, and heroin Even in China itself the use of smuggled morphine was much more serious than the opium addiction The Chinese Government was resolved to fight the drug evil, but its hands were bound by treaties China could not control the opium supply in its own country because many foreign Powers enjoyed extra-territorial rights which put their nationals beyond the jurisdiction of the Chinese authorities

The suggestion was made by the Polish delegate (M Sokal) that the League should fight the drug traffic, not by police measures, but by educational appeal, which was possible under Article 6 of the Hague Convention He urged that the cinematograph and the lecture should be employed in anti drug propaganda The proposal was supported by Mr MacSwiney, delegate for the Irish Free State, and by Mlle Vacaresco for Rumania On the other hand, the Hon R Dandurand (Canada) said that the very best propaganda against the use of noxious drugs was the kind of propaganda for which Canadian legislation provided, this imposed severe penalties on persons selling and purchasing these drugs The Canadian Government had mobilized a whole police force to hunt out the offenders, and had sent over to Europe to trace out the headquarters from which the consignments came No form of propaganda was so effective as to make it a penal offence to sell, purchase, or distribute such drugs A proposal from M Seferiades (Greece) was to institute severe penalties against writers whose books, circulated throughout the world, had the effect of encouraging young people to use these noxious drugs

After a very long discussion, which occupied two sittings of the Fifth Committee, a series of recommendations were carried, which will be considered by the Assembly before it rises These were in harmony with the report of the Advisory Committee already summarized.

Nova et Vetera.

SMALL-POX AND INOCULATION IN THE EIGHTEENTH CENTURY

THE reviewers of the *Diary of a Country Parson*, kept by the Rev James Woodforde, a Somersetshire man, curate of Castle Cary in that county, and afterwards Rector of Weston in Norfolk, have laid stress on his records of the astonishingly copious dinners he gave or shared, and we have already quoted one instance A closer reading of the Diary tends to modify the impression then conveyed He evidently liked a big dinner, and while a Fellow of New College, Oxford, was present at some very big ones, but incidental references show that his own table, though amply furnished, was usually simple enough, and cold meat and hashes recur frequently When on a special occasion he entertained a party of six friends at his rectory he gave them a "dish of mackarel, 3 young Chicken boiled and some Bacon, a neck of Pork roasted, and a Gooseberry Pye hot" This "brought on me the Hickupps with a violent pain in my stomach which lasted till I went to bed" The dinner, it must be remembered, began probably at about 3 in the afternoon He dined once with his wine merchant in Norwich, who for seven people had some "Norfolk Dumplins and a Goose, a very poor dinner for so many of us I think" Geese then must have been small, for on December 23rd Woodforde paid for a fatted goose at 9d a pound, 2s 9d, so that the bird was no bigger than an average chicken of to-day

The squire of Weston kept a more lavish table, and a visit to him might mean two solid meals One day in September, 1778, when the parson left his house at 2 o'clock, he arrived in time for the squire's dinner Four persons, two ladies and two men, sat down to a first course of "some common fish, a leg of mutton rosted, and a baked pudding," and for a second course had "a rost duck, a meat pye, eggs and tarts", for supper they had "a brace of partridges rosted, some cold tongue, potatoes in shells and tarts" Woodforde got home about 10 30, carrying a brace of partridges with him

As the diary belongs to the period 1758-81, and contains day-to-day notes on passing events, it could not fail to make incidental references to small-pox and to small-pox inoculation On December 27th, 1759, "My great Aunt Ann Woodforde died of the small-pox at Bicester this morning" On August 3rd, 1766, "I buried a little maid of Phill Stockman's this evening at C Cary that died in the Small Pox" In 1768, on September 29th "I buried Thos Roach of Bruton, who died in the smallpox there, a poor wild creature he has been I had a black silk hatband and a pr of black gloves sent me for burying him by his good brother, who was at the expense in burying him handsomely" On August 3rd, 1776, he writes, 'George Marton's little boy John came to live with me last thursday He does not sleep in my house as he has not had the small-pox The Boy is about 10 or 11 years of age" On November 22nd, 1776, "My neighbour Downing, Father of the Children that were lately inoculated has got the smallpox in the natural way and likely to have it very bad," so Dr Thorne was sent for and visited, but on November 28th "Poor Neighbour Downing very bad indeed this evening the Small Pox being upon the turn I went to him and saw him, his Pulse was very high owing to drinking some Beer etc to day I ordered them to give him some electuary in warm water, and when I came away he seemed a little better My man Ben I ordered to sit up with him to night" Fortunately he made a good recovery On December 1st "I went and saw Downing after church this morning, and he is brave I thank God for it" On January 21st, 1779, it is recorded "Poor Js Pratt died this afternoon in the small Pox in the natural way He never could be prevailed on to be inoculated He has left a wife just ready to be brought to bed, with 6 more small children Pray God send comfort to the poor widow and Family" On March 19th, 1781, "Sent by my Maid Betty to one Tooley, whose family has got the Small Pox and is very poor, 0 2 6"

The diarist had a brother-in-law, Dr Clarke, who practised inoculation extensively and had a special hospital for the purpose Clarke was a correspondent of, and well acquainted with, the author of a famous work on inoculation, Dr Dimsdale of Hertford, who went to St Petersburg to inoculate the Empress Catherine and her son the Grand Duke Paul The story is well known, and is told in the Diary by the editor, Mr John Beresford The Empress had perfect reliance on Dimsdale, but could not trust her subjects in case of disaster, and to facilitate his escape if necessary, had relays of horses provided from St Petersburg to the extremity of her dominions But all went well, Dr Dimsdale received £10,000 with £2,000 for expenses and an annuity of £500, was made a baron, and the banking firm of Dimsdale carried on the name

Dr Clarke's method of inoculation is not described in the Diary If he copied his friend Dimsdale he did well, as Dimsdale did not practise the severe method, with encouragement of free suppuration, on the theory that it expelled peccant matter from the system, a theory and practice which did much mischief The diarist, however, mentions incidentally that "John Bowles' Wife is under Inoculation, was inoculated by one Drake formerly a sergeant in the Militia He makes a deep incision in both arms and puts a Plaister over," his charge for this badly done operation being "5/3 each," and that was the fee paid by Mr Woodforde for inoculation in his own household

Mr Woodforde in 1768, referring to the burial of two small children who died of small-pox, writes "I must say it is very cruel of Robin Francis not to have had them inoculated" When he removed to Norfolk his family medical attendant was Dr Thorne of Mattishall It was he who inoculated Mr Woodforde's servants, and his method is evidently described in the MS diary, but is not stated in the published volume Dr Thorne wanted Downing, who had been infected by his inoculated children, to let some matter from his eruption be taken for inoculation purposes, but Downing refused There is no mention of matter having been taken from the inoculated patients, either from the arm—the "mother pustule"—or from the resulting eruption, so perhaps Thorne preferred virus for inoculation direct from the eruption of small pox by infection, not by inoculation The editor of the Diary, records, without comment, how inoculation came to be regarded as a public danger owing to the fact that, through lack of precautions, the inoculated were apt to infect others, and the Downing case is a clear example of such occurrence In country districts, where inoculation was not extensively practised, and where small-pox was less prevalent than in towns and cities, the risk due to infection from the inoculated was undoubted But where inoculation was extensively adopted, whether in city or village, so many were protected in this way that much fewer were left under risk of infection, and inoculation on balance probably did much more good than harm The Royal Commission on vaccination devoted a good deal of attention to this point, and concluded that, taking the population, urban and rural, as a whole, the available evidence was insufficient to determine whether the balance was on the side of advantage or disadvantage

A number of other diseases are mentioned incidentally in the volume, there are a good many references to gout and rheumatism, and consequent visits to Bath The diarist himself when 29 was ill for a week with what may have been measles, and immediately after taking the degree of B D in 1735 was "very bad indeed in the influenza," but after dosing himself with brimstone, cream of tartar, and treacle, living "very low" and going to bed early, he rapidly recovered We have found only one reference to ague (the index does not help) The patient was no doubt an under servant

> May 22nd, 1779 My Boy Jack had another touch of the Ague about noon I gave him a dram of gin at the beginning of the fit and pushed him headlong into one of my Ponds and ordered him to bed immediately, and he was better after it and had nothing of the cold fit after, but was very hot

But Woodforde had milder remedies also, he was fond of taking salts himself and giving them to other people, and, like Sydney Smith, was a great believer in rhubarb

British Medical Journal.

NEW LIGHTS ON THE JAUNDICE PROBLEM

We publish this week (p 495) a full report of the discussion on jaundice in the Section of Medicine at the meeting of the British Medical Association at Bradford, under the chairmanship of Dr W Langdon Brown, whose lecture on changing standpoints in metabolic diseases, including diabetes was published recently in our columns (1924, vol i, p 1119) The selection of this subject was well timed, for it is now more than two years since Dr J W McNee drew attention in the JOURNAL (1922, vol i, p 716) to Professor A A Hijmans van den Bergh's test with Ehrlich's diazo reagent for bilirubin the method has since then been widely employed in this country, and a comparison of results might be expected to prove useful There is the perennial question (of more than usual interest at the moment) whether there is a true haemolytic jaundice—that is to say, one produced entirely apart from any activity of the hepatic cells Opinion on this matter must largely be determined on the experimental evidence, derived from animals during the period of survival after complete removal of the liver Many, however might well agree with Sir William Willcox that the clinical evidence in favour of the existence of a true haemolytic jaundice is more convincing than the results obtained in animals after severe operations which produce very abnormal conditions for metabolism, and in fact the results of experimental removal of the liver are as yet somewhat conflicting Minkowski and Naunyn's observation in 1886 that jaundice did not occur in the absence of hepatic activity carried conviction until, in 1913, Whipple and Hooper disturbed opinion and, indeed, made the pendulum swing back to the older conception of jaundice as due to the formation of bile pigment in the circulation without any participation by the liver At the same time (1912 13) Dr J W McNee brought forward evidence in favour of the very important view that bilirubin is manufactured out of haemoglobin by von Kupffer's star like cells now known as the reticulo endothelial system, which occur in the splenic sinuses, along the capillaries in the liver, in the bone marrow, and elsewhere, their distribution in and outside the liver varying in different animals After Whipple and Hooper's publication medical opinion perhaps too suddenly, accepted the experimental evidence, which clinicians certainly were willing to welcome—that jaundice may be due to haemolysis rather than to hepatic disorder But on repeating Whipple and Hooper's experiments, Rich of the Johns Hopkins Hospital (1923) and McNee and Prusik (1924) failed to confirm the new conclusion and Oppenheimer (1924) also of the Johns Hopkins Hospital, did not find any evidence of the formation of bilirubin in isolated limbs Mann of the Mayo Clinic, however, by an elaborate technique, involving less shock to the animal, kept the dogs alive by injections of glucose for twenty four hours after the liver was completely removed and confirmed Whipple and Hooper's observations In these circumstances the clinical evidence in favour of the production of a true haemolytic jaundice, such as the formation of bile pigment in haematomas and intracerous haemorrhages, still has some significance

Dr J W McNee opened the discussion by an extremely able and clear review of the whole problem of jaundice, and most fortunately, was followed by Professor A A Hijmans van den Bergh of Utrecht, whose work has now enabled the investigation of jaundice to be based on estimation of the bilirubin content of the blood, just as that of renal function is based on determinations of the blood urea, and the treatment of diabetes and the significance of glycosuria elucidated by examinations of the blood sugar Van den Bergh's test enables the amount of bilirubin in the blood serum to be estimated quantitatively, and has also shown that there are two forms of bilirubin one is present in the blood serum in the jaundice due to gross mechanical obstruction of the bile passages whereas the other bilirubin is met with in the blood serum when there is jaundice without any obstruction to the exit of bile from the bile capillaries and ducts A diagnosis can thus be made between obstructive and non obstructive jaundice, and from a practical point of view, this is of great importance in its bearing on the question of operative treatment of the bile passages Both forms of bilirubin (the exact difference between them being as yet undetermined) are manufactured by the cells of the reticulo endothelial system, it is believed however that whereas the form which gives the direct reaction with van den Bergh's test is further modified by passage through the polygonal cells of the liver, the form which gives the indirect reaction has not been so influenced by the liver cells This second form of bilirubin is found in cases in which jaundice is, on clinical grounds, thought to be due to the formation of bile pigment outside the liver—namely, in true haemolytic jaundice, it occurs also when, from degenerative changes the liver cells are unable to receive and act on the bilirubin formed by the cells of the reticulo endothelial system In addition it is suggested by Dr McNee that when from excessive haemolysis bilirubin is formed by the reticulo endothelial cells in quantities too large for the polygonal cells of the liver to deal with, some of the bilirubin may escape straight into the radicles of the hepatic veins and so cause jaundice, while the bilirubin acted upon by the polygonal hepatic cells passes into the bile capillaries and so into the duodenum and colours the faeces

Some observers who have employed the van den Bergh test have found that it has not come up to their expectations in providing a cut-and-dried diagnosis, thus, in the discussion, Dr H L Tidy referred to cases of clinical doubt as to a distinction between gall stone obstruction and catarrhal jaundice in which the test did not solve the difficulty Dr McNee clearly pointed out that in jaundice due to incomplete obstruction and in toxic and infective forms of jaundice the test cannot be relied on to give an absolute diagnosis This is due to the fact that in much the largest group of cases of jaundice—the toxic and infective hepatic jaundice—van den Bergh's test often gives a biphasic reaction, because not only is there a toxic disorder of the polygonal hepatic cells (which would produce an indirect ' reaction), but also some cholangitis causing mechanical obstruction and so a direct reaction This combined form of jaundice is well illustrated by so called catarrhal ' jaundice, in which the van den Bergh reactions vary at different stages of the disease, and there is reason to believe that the liver itself is affected rather than that

the lesion is inflammation, or the traditional plug of mucus, limited to the lower end of the common bile duct Sir William Willcox emphasized the hepatic involvement in "catarrhal" jaundice, which he regarded as the same as the "epidemic catarrhal" jaundice of the war, and stated that cases of "catarrhal" jaundice could always be shown to exhibit definite impairment of hepatic function by employing the laevulose test

A very suggestive point was raised, but not pursued very far, by Dr McNee in his inquiry as to what might occur in the event of damage to the cells of the reticulo endothelial system Although there is no clinical evidence on this subject, it is obvious that if, as there is good reason to believe, they manufacture bile pigment, any extensive degeneration affecting them would result in a diminished formation of bile and so modify digestion and metabolism in ways that may require further investigation Occasionally in acute yellow atrophy, more correctly called acute necrosis, of the liver, and in intrahepatic calculi jaundice is absent, and it is conceivable that in such cases—which admittedly are very rare—the reticulo-endothelial system may be at fault, and that thus the old conception of complete cessation of the bile-forming function of the liver may, to some extent at least, be explained

The van den Bergh test is of value, and its importance in this respect will probably be increasingly recognized, in the detection of latent jaundice—in cases, that is to say, in which, although there is no pigmentation of the skin or bile pigment in the urine, the blood, as proved by a quantitative estimation of its bilirubin content, shows a definite increase of this pigment Latent jaundice has thus been shown to occur in pernicious anaemia and in hepatic cirrhosis Quite recently the search by van den Bergh's test for latent jaundice has been put to a very practical use by Surgeon Lieutenant-Commander W I Gerrard,[1] who has found that the detection of latent jaundice in syphilitic patients under treatment by arsenobenzol compounds is a danger signal, and therefore a means of controlling this valuable form of treatment, among the toxic results of which are jaundice of various degrees of severity and even acute necrosis of the liver Professor van den Bergh mentioned that latent jaundice is important in distinguishing pernicious from secondary anaemia, in which it does not occur, and that in a cardiac patient its appearance points to incipient cardiac failure He also instanced as a use of the test the distinction between lutein and bilirubin in the blood serum, and drew attention to the occurrence of pseudo-jaundice in man, due to eating considerable quantities of green vegetables, as by no means a rare event Carotinaemia, or pseudo jaundice due to eating carrots, has been described, and Professor van den Bergh referred to the occurrence of this lutein jaundice in diabetic patients, and even to its presence having aroused a suspicion of cholelithiasis Lastly, the new conception of the bilirubin-forming function of the reticulo endothelial system raises a number of new problems in connexion with the liver-spleen diseases on which Eppinger, Professor Wenckebach's first assistant in Vienna, has written a suggestive monograph[2] Such problems are the possible existence of diseases due to lesions of the reticulo endothelial system, and the relations of haemolytic jaundice, Hanot's biliary cirrhosis, Banti's disease, and splenic anaemia, as was indeed suggested by Sir Berkeley Moynihan, who, in pleading for more close collaboration between the too artificial divisions of the profession, described the surgeon as "the most formidable weapon of inquiry ever placed in the hands of the physician"

RELATION OF GOITRE TO THE IODINE INGESTED

WITHIN recent years it has been established that iodine want is an important factor in the causation of thyroid hyperplasia and goitre Knowledge of how this want may be brought about is, however, still vague, although there is good reason to believe that it may be caused by inadequate assimilation as well as by inadequate intake in food and drink The investigation of iodine metabolism, of the part it plays in normal processes, and in particular its relation to the thyroid gland, involves studies in which the chemist, the physiologist, the bacteriologist, and the clinician each has a part to play Among the more notable of recent contributions to this problem is that of Professor J F McClendon of the University of Minnesota and J C Hathaway of Minneapolis[1] These chemists have provided a number of interesting and important facts as to the distribution of iodine in food and water, and although we are inclined to look on their conclusions in regard to the relation between goitre and the iodine content of food and drink as somewhat premature, yet their work is of a kind which has interests apart from the restricted view the authors themselves appear disposed to take

They find, as did Fellenberg in Switzerland, that food and water from goitrous regions in the United States of America contain less iodine than the same articles from non goitrous regions They find, moreover, that wheat is low in iodine content, that the iodine is contained mostly in the coarse parts which are removed in the process of manufacture of white flour, so that the flour itself contains iodine only in insignificant quantities The chief sources of iodine in land products—as distinct from sea foods—are milk, butter, fruits, and leafy vegetables Even sea foods, such as salmon and other fish, appear to be deprived of much of their iodine value by canning, so that tinned salmon contains less iodine even than some leafy vegetables raised in goitrous regions The authors consider that they have proved statistically that both simple and exophthalmic goitre are caused by iodine starvation, and their suggestion seems to be that in the United States of America the distribution of goitre is a matter of the distribution of iodine in the food and drink

If iodine want be an immediate cause of goitre—and we do not doubt that it is—then it is evident that the malady will be more likely to arise in localities where the intake of iodine in the food and drink is low than in others where it is high, but we venture to doubt whether the etiology of goitre is capable of so simple an explanation as this From the results recorded by these observers it would appear that a diet composed mainly of white bread and tinned fish, with a minimum of milk, fresh butter, fruit, and leafy vegetables, is apt to be attended by the development of goitre, whereas a diet into which whole meal, milk products, fruit, and leafy vegetables enter more largely is the less likely to be associated with goitre even in regions where it is endemic Unfortunately there are many in this country whose diet conforms more closely to the former than to the latter class, and whatever maladies

[1] *Journal of the American Medical Association* May 24th p 1668

may be associated with its habitual use goitre cannot be said to be the most prominent among them On the other hand, there are many persons in goitrous districts in other countries than the United States whose diet conforms to the second class and who nevertheless are the subjects of goitre It may be argued that the former have sources of iodine supply not available to the latter, but it would seem that we must go deeper than mere intake of iodine and have regard to factors of mastication, digestion, and assimilation, and of the bacterial flora of the gastro intestinal tract Indeed, the work under review brings the problem of goitre production still more into the gastro intestinal zone, so to say, and raises problems for the solution of which estimation not only of the iodine ingested but also of the iodine assimilated and excreted is necessary The matter does not end even here, for questions arise as to the capacity of the thyroid to make use of the iodine assimilated, or relative deficiency of iodine in respect to other constituents of the food, and of the needs of the tissues, under varying conditions of life, for the active principles of the thyroid gland, of which iodine is but one of the constituents, although a main one Accepting the authors results, and assuming that similar results will be recorded for other goitrous and non goitrous regions, and that iodine want, however brought about, is an immediate cause of goitre, then we think that McClendon and Hathaway may well claim to have fitted into place another piece in the jig saw puzzle of goitre, but there are still many pieces to be fitted before the picture can be said to be complete

We find it very difficult, however, to accept the contention that exophthalmic goitre is caused by iodine starvation, for exophthalmic goitre is rare in such goitrous regions as the Alps and Himalayas Indeed, in the latter it is almost wholly unknown amongst the indigenous inhabitants Were both simple and exophthalmic goitre caused by iodine starvation the one malady should be as common as the other in these regions In any attempt to solve the problem it is absolutely necessary to maintain the widest possible outlook The iodine deficiency theory of simple goitre is attractive at first sight, but there are many matters which cannot be explained on this theory alone For example, how is it that goitre may be more common in one village than in another, in one household than in another, or absent entirely from one village or household when the food and drink are the same? Why is goitre so largely a disease of the female sex and so intimately related to different age periods? Is it that one village, one household, one sex, or one age requires more iodine than another, or is it that factors other than, or in addition to, iodine supply determine the occurrence of the disease?

The observations of McClendon and Hathaway on the distribution of iodine in foods call to mind the distribution of vitamins, and emphasize once more the great importance for nutrition and for the prevention of disease of the habitual use of milk products, fruit, and leafy vegetables and the evil results which may follow the habitual consumption of sophisticated foods It reminds us also of the problems still unanswered with regard to such a disease as beri beri, not long ago it was thought to be caused solely by want of vitamin B, but it is now known that there are other factors in its causation The observations provide also another example of the importance of the study of the conditions of growth of food products and of the relation of soil composition and of manures to the nutritive value of food grains—or the relation, in short, between the chemical composition of the soil and disease production It indicates, too, that soil composition is not without its influence, exercised through food and drink on certain endocrine structures, as these are believed to be intimately concerned with the characteristics of races and of individuals the character of the soil on which different races live may eventually be proved to account in some measure for differences in their make up

We have given a good deal of space to this paper by McClendon and Hathaway because their investigation has brought to light or confirmed important facts, and because the whole argument stimulates thought But we must repeat the warning against accepting the authors' conclusions without careful consideration of all the facts—not only those they record, but also those of other observers and experimenters The statement with which the paper opens, to the effect that they have proved both simple and exophthalmic goitre in the United States to be caused by iodine starvation, is far too dogmatic The results they have obtained must be studied in relation with those reached by other workers who have followed other lines of thought or have attacked the problem from a different angle Eventually all such work must come before the tribunal of clinical experience, which is the final arbitrator in all things medical

CANCER IN THE COTTON TRADE

In the BRITISH MEDICAL JOURNAL of November 18th, 1922 (p 971), two Manchester medical men, Mr A H Southam and Mr S R Wilson, published a paper drawing attention to the prevalence of cancer of the scrotum amongst a certain section of cotton spinners As a result of investigation of cases of scrotal cancer admitted to the Manchester Royal Infirmary during a period of twenty years they had found that 53 per cent of these cases were engaged as mule spinners Another interesting observation was that in 84 per cent the growth was situated on the anterior aspect of the left side of the scrotum As a result of further inquiries and visits to cotton mills round Manchester they expressed the opinion that this could be explained by the conditions under which the spinner works Two factors seemed chiefly to be concerned—chronic irritation from the contact of the scrotum against the faller bar of the machine and the presence of the oil thrown off from the machine, so that the spinner's clothes became saturated with it This paper naturally aroused considerable interest, and caused some alarm in the Lancashire spinning trade Later inquiries, however, served to show that cancer of the scrotum was even more common among mule-spinners than had been suggested, and the disease is now generally known in Lancashire as "spinner's cancer" A further point of interest is that down to the date of the paper not a single case had been notified under the terms of the Factory and Workshop Act, 1901, although mineral oil is definitely mentioned in the Secretary of State's Order of January, 1920, the Home Office had no record of the prevalence of the disease Inquiries showed that medical men had not realized that the disease might be due to the spinner's occupation Since, however, attention was drawn to the condition a large number of cases have been notified to the Home Office, which has collected 145 cases of epithelioma of the skin in mule-spinners Early this year a test case was heard before Judge Mosop at the Ashton-under-Lyne County Court The application was under Schedule 12 of the Industrial Diseases Act, and the applicant, a cotton-spinner, sought compensation on the ground that while following his occupation he had contracted epithelioma of

the scrotum The case was regarded as of the utmost importance to the whole of the Lancashire cotton trade, the issue being whether the disease was due to the nature of the employment The case was largely fought out on the medical evidence Judgement was given in July in favour of the applicant The judge stated that the conclusion appeared to be irresistible that there was a connexion between the employment and the disease It was at first decided to lodge an appeal against this judgement, but on September 8th it was officially notified that the Master Spinners' Federation had intimated to the Operative Spinners' Amalgamation that it had decided not to appeal It appears that this decision was arrived at after taking expert legal advice It was felt that in view of the declaration of Mr Southam and Mr Wilson, who had been pursuing research work in the matter for years, it would be useless to appeal without positive evidence negativing the view that the disease arises from the occupation, and this was not forthcoming There are at present about one hundred cases on the books of the Operative Spinners' Amalgamation, and the question of compensation, which has necessarily been deferred, will now be dealt with It is said that this will amount to a considerable sum each year It seems probable that epithelioma of the scrotum will now be scheduled under the Workmen's Compensation Act so as to apply to spinners Owing to the prevalence of the condition it is to be desired that the characters of the oil used should be carefully investigated, and that precautionary measures shall be taken to reduce the incidence of the disease We understand that the attention of Lancashire members of Parliament has been drawn to the condition, and a further report is to be presented to them later It only remains to add that the decision has caused great satisfaction in Lancashire, and that it is thought to mean a great deal to the future of the industry

TREATMENT OF GLANDERS IN MAN

GLANDERS—or farcy, as the disease is called when the local lesions are found on the skin—is one of the oldest diseases definitely known to medicine It was recognized by Hippocrates in 450 B.C., and by Aristotle a century later Absyrtus, the Greek veterinarian in the army of Constantine the Great, described it with considerable accuracy and recognized its contagiousness Glanders is essentially a disease of the Equidae, in which, as a rule, it runs a more or less chronic course, but it is easily transmitted to man and the Carnivora—especially the Felidae—and in these subjects it is often acute or even peracute In Britain the disease is now very uncommon, although quite recently an outbreak occurred among the large cats in one of the zoological gardens, the outbreak was traced to a chronic case of glanders in one of the horses slaughtered for food Glanders is still common in the less highly civilized parts of the world, and records of the disease occurring in man are still accumulating Various outbreaks have been reported from Russia, but authentic information is still difficult to obtain from that country However, it has been recently reported[1] that Dr Derbeck of the Veterinary School of Berne died from chronic glanders contracted during the *post-mortem* examination of a diseased horse During the autopsy on Dr Derbeck, Dr Sole of the Pathological Institute of Prague also became infected and died, three other deaths have been ascribed to the same horse Even laboratory workers run no inconsiderable risks, as is shown by the death of the acting director of the Government Sero-therapeutic Institute at Prague while investigating glanders from the clinical and serological points of view These reports serve to emphasize the fortunate position in which we in this country find ourselves The almost complete absence of glanders from Britain is of comparatively recent date, and in no small measure due to the activities of the Ministry of Agriculture and the officers of the Royal Army Veterinary Corps In mallein a sure and safe diagnostic agent was found, and by the prompt slaughter of all reactors the disease was soon eliminated, not only from this country, but also from the huge numbers of horses returned from the war areas Mallein is named after the causal organism of the disease—*Bacillus malle*, the old name for glanders, malleus, is to be traced to Aristotle, being derived from μῆλις=bad disease, or epidemic Mallein is comparable to tuberculin, and the test is made in various ways—subcutaneous, ophthalmic, and intradermo-palpebral, the last is the most popular Treatment of the disease is not permitted in this country, reactors must be at once slaughtered and suitable measures of disinfection adopted In man the disease is usually contracted by inoculation of contaminated material, but it is probable that there also exist intestinal infections with a morbid picture very similar to that presented by typhoid fever Although by no means always fatal, glanders in the human subject is always serious, and the possibility of a further advance in its treatment has been suggested by the recent work of Watson and Heath in America These workers were able to show that the horse can be hyper-immunized by repeated inoculations of mallein Several human cases have been treated with this serum in Canada with dramatic results Cases which have been regarded as very serious quickly responded to the treatment, and although the data are still insufficient to allow definite conclusions to be drawn the results obtained indicate that specific serum treatment is probably of considerable value in promoting a cure

[1] *Zeit f Infect*, Part B, vol xxv

VOLUNTARY HOSPITAL FINANCE

IN JANUARY, 1921, the Minister of Health appointed a committee to consider the then existing position of the voluntary hospitals in Great Britain, and one of its recommendations was that assistance should be given from public funds A grant of £500,000 was received from the national exchequer, and the Minister of Health thereupon appointed the Voluntary Hospitals Commission to administer it in accordance with the conditions prescribed In February, 1923, the Commission issued an interim report giving particulars of its work of administration down to December 31st, 1922, and this report was considered in detail in the SUPPLEMENT of March 3rd, 1923 (p 71) The Commission has now issued a second interim report,[2] which deals with the period from January, 1923, to March 31st, 1924, when the distribution of this money was completed The disbursement of the grant proceeded in three stages (1) The first distribution was made in respect of deficits on current maintenance accounts for the year ending December 31st, 1921 (2) A supplementary distribution in respect of accumulated deficits (3) The final distribution of the small balance remaining In the first interim report the amount distributed up to December 31st, 1922, was reported as £372,013, of which £225,000 had been received by London, £145,218 by England and Wales, and £1,795 by Scotland, this allocation was in respect of deficits on the maintenance account for the year ending December 31st, 1921 The distribution of grants in respect of 1921 deficits was completed by March 31st, 1923, the final figures being London, £225,000, England and Wales, £194,242, Scotland, £7,411 A total sum of £426,653 had thus been distributed, and a balance of £73,347 remained in the hands of the Commission This balance was devoted to the assistance of hospitals with serious accumulated deficits, £45,753

[2] *Journ Amer Vet Med Assoc*, lxv, pp 146 153

[3] London H M Stationery Office, or to be purchased directly through any bookseller 1924 6d net

being allotted to England and Wales and £27,589 to Scotland Local committees were required to submit proposals for distributing the sums allocated to their respective areas, and also to raise county funds so that the Treasury condition relating to the collection of additional money should be fulfilled By the latter part of 1923 the sums distributed were England and Wales, £38,937, leaving a balance of £6,821, and Scotland, £17,544, leaving a balance of £10,045 The Commission had thus at its disposal a sum of £16,866 for final distribution Grants were allocated to hospitals with heavy accumulated deficits which had had only scanty assistance from the Commission hitherto, help was also given to some hospitals which had previously had none owing to their inability to comply with the condition laid down by the Treasury, this condition the Treasury now relaxed in exceptionally hard cases The total amount disbursed in this final distribution was £10,046 in England and Wales and £6,820 in Scotland In an appendix to the report a complete detailed list is given of all the grants paid to hospitals outside the London area Details of the grants to the London area were given in the first interim report of the Commission These grants have in many cases prevented the closing of beds and in others have led to their reopening The condition that the Government grant was only payable on a pound for pound basis against new money raised from voluntary sources has had a most invigorating effect on the flow of voluntary subscriptions The report concludes with a suggestion that the voluntary hospitals should now for the most part be able to balance their budgets They are, however, still confronted with the most serious question of the provision of additional accommodation The Commission has now been requested by the Minister of Health to undertake an inquiry into this need and the best means of meeting it A conference of local committees was convened last June by the Commission and a valuable interchange of views was obtained relating to the procedure to be followed in this investigation

THE UNIVERSITY OF PADUA

THE services of the University of Padua to mankind have been so splendid that even her statistical record is of interest to all, not least to the countrymen of Harvey In the current number of *Metron*[1] Subante, Vivarini, and Voghera publish the results of a laborious investigation of the statistics of students in the university from the end of the sixteenth century to the present time Originally a school of civil and canon law, at a very early date a department of arts, covering literature, philosophy, medicine, mathematics, and general science, was instituted, and this division was maintained until 1805, after that date the familiar division into faculties was adopted The registers of students in the arts division—that which, as they include the medical students, particularly interests us—only go back to the academic year 1633-4, when there were 71 students, the numbers increased at first slowly, reaching 312 in 1656-7 and 501 in 1675-6, it was in the period 1610-70, as we shall see, that Padua exercised its greatest attraction upon English medical students The maximum was reached in 1688-9, with 557 students In the eighteenth century the numbers declined to a minimum of 78 in 1769-70, and in the last year of the old classification, 1805-6 there were 186 In 1806-7 the faculty of medicine, surgery, and pharmacy contained 158 students, in 1865-6 there were 359 The recent history of the faculty of medicine and surgery (exclusive of the schools of pharmacy and obstetrics) shows a decline from 1898-9 to the war years, the number was 336 in 1898-9 and 312 in 1913-4 Since the war there has been a considerable increase, the record for 1922-3 gives 630 in the faculty of medicine and surgery, 233 in the school of pharmacy, and 340 in the school of obstetrics The distinction of nationalities is interesting, but, unfortunately, before 1674 the English are not shown separately, but presumably merged under the heading "Natio ultramontana sive Germanorum" The largest number of such students in any one year was 51 in 1648-9 Between 1674 and 1805 'Inglesi" are shown separately, and there are but two—one in 1675-6, one in 1696-7 These figures, however, suggest that the registers used by Subante, Vivarini, and Voghera are incomplete In Munk's *Roll* of the Royal College of Physicians of London there are recorded three Englishmen who certainly and two who probably graduated M D at Padua later than 1674 The famous Richard Mead graduated on August 16th, 1695, John Arnold took his degree on January 17th, 1715, and George Macaulay on April 16th 1739 Sir Richard Blackmore, the minor poet, and Thomas Palmer were also Paduan graduates of a date later than 1676 Possibly Mead is the Englishman of 1695-7 and Blackmore the student of 1675-6 The number of English medical graduates in the seventeenth century was large—we find from Munk's *Roll* 65, the greatest proportion was in and about 1640-70 From 1680 to the end of the century there were only four, or five reckoning Mead, who comes into the College *Roll* after 1700 Macaulay in 1739 seems to have been the last Of these graduates Harvey is, of course, without a peer, he graduated on April 25th, 1602 Next to him in fame, if longo intervallo, was Sir George Ent, eight times President of the College and an original Fellow of the Royal Society Ent was five years in Padua and graduated on April 28th, 1636 Before the seventeenth century only seven Fellows or Licentiates of the College of Physicians are recorded to have graduated at Padua, but one of them was the great Caius, who became M D on May 13th, 1541, and the founder, Linacre was another Leyden is the only other foreign university having so many alumni in the *Roll* of the London College

STANDARDIZATION OF DYSENTERY SERUM

AT the request of the Health Committee of the League of Nations, Dr Kiyoshi Shiga and other workers at the Kitasato Institute for Infectious Diseases, Tokyo, have begun an inquiry into the methods of standardization of dysentery (Shiga) serum, and a preliminary report[1] has been published It embodies the results of a series of experiments extending over a year and a half and the inquiry seems likely to point the way to more accurate methods of producing antidysentery serum The methods of preparation and standardization of serum for the treatment of diphtheria and tetanus are reliable and accurate Units of toxin and units of antitoxin can be measured with precision, and a consistent supply of trustworthy serum can be maintained by an efficient laboratory But the preparation of serum for the treatment of dysentery has always presented difficulties because of the absence of precise methods of standardization It would be a substantial advance if a standard antidysentery serum of the same stability as antidiphtheria serum could be produced The report of the Japanese workers is concerned with the study of the conditions under which the dysentery bacillus produces toxin, and with the preparation of immune serum It was found by experiment that the toxicity of a bouillon culture of Shiga's bacillus is highest after two weeks growth, and that the optimum alkalinity for toxin-

[1] League of Nations Health Organization *The Standardization of Dysentery Serum* First Report by Kiyoshi Shiga, H. Kawashima, T. Uchiyama, Geneva 1924.

tion was at a *p*H of 8·0 to 8·4. When the bacillus is inoculated into neutral broth some slight degree of acidity is produced, and reaches its maximum in two to three hours. After one to two days the slight acidity disappears, and the reaction gradually becomes alkaline. The alkalinity increases till *p*H 8·6 is reached, where it remains for a long time. It was found that as the reaction swings to the alkaline side of neutrality the toxicity of the broth culture steadily increases, keeping pace with the increasing alkalinity till the toxicity also reaches a maximum. Unless the medium develops an alkalinity above *p*H 8·0 a powerful toxin cannot be obtained. Concerning the preparation of immune serum this interesting and important observation was made—a filtered toxin of a broth culture was found to be unsuitable for immunization of animals, but heated bacteria grown on agar medium or the autolysed bacteria were very effective. Immunization with dysentery bacilli led to a higher degree of immunity, and was less harmful to the animals than injections with broth cultures or filtered toxins. It appears that the neutralization of the dysentery toxin by antitoxin follows the law of multiple proportions fairly closely. The efficiency of an immune serum may be gauged with some degree of accuracy, using a lethal dose of toxin as the standard. These are the main conclusions of the first report, and it seems likely (judging from a sentence in the preface) that in the further report which is promised we may expect equally clear and definite advances.

ELECTRONIC REACTIONS OF ABRAMS

THE committee appointed by the *Scientific American* to investigate the "E R A" cult has made the following final report after a year's work [1]:

"OUR VERDICT

"This Committee finds that the claims advanced on behalf of the Electronic Reactions of Abrams, and of electronic practice in general, are not substantiated, and it is our belief that they have no basis in fact. In our opinion the so-called electronic reactions do not occur, and the so-called electronic treatments are without value."

This is signed by the members of the committee—Dr. William H. Park, director of the Bureau of Laboratories, New York Health Department, Dr. Walter C. Alvarez, associate professor of research medicine in the University of California, Mr. Robert C. Post, a civil engineer, Mr. J. Malcolm Bird, associate editor and "psychic investigator" to the *Scientific American*, and Mr. Austin C. Lescarboura, the managing editor of that periodical. The report itself calls for no comment or amplification, since it is an absolutely unqualified condemnation of the works and pretensions of the E R A cult, but certain points connected with the investigation deserve attention. The *Scientific American* is a monthly journal of international repute which gives general information on the progress of science. For many years it has conducted investigations into psychic phenomena and other subjects on the borderland of science, and it has gained a high reputation for the careful and impartial manner in which it has conducted such investigations, in particular it has always been ready to admit the fact when it has encountered phenomena which apparently cannot be explained by known scientific laws. It can therefore claim to be completely impartial in the dispute between medicine and the E R A cult, and to have special experience in conducting investigations dealing with apparently inexplicable phenomena. The *Scientific American*, when it commenced its investigation last year, was generally held to be biased, if anything, in favour of the electronists, and since the investigation received the hearty endorsement of the electronists, headed by Dr. Abrams himself, they offered to put all facilities and services at the disposal of the committee. The progress of the investigation has been reported in the *Scientific American* from month to month during the past year, and it does not seem to have been the fault of the committee that the monthly articles have largely consisted of accounts of the various devices by which the electronists have evaded any impartial investigation of their claims. Every investigation made resulted in complete failure. The only thing that has never failed has been a crop of explanations to account for the failures. The medical profession in this country has been criticized for its unwillingness to investigate the E R A claims, and therefore it is worth while to point out what such an investigation involves. The investigation just concluded started with every advantage. It was conducted by an impartial authority, it was endorsed by the electronists, and it was conducted in America, the home of the recognized leaders of the cult. In spite of these favourable circumstances, the committee had the utmost difficulty in arranging any tests, and the investigation took twelve months when it might have been anticipated that conclusive results could have been obtained in as many days. Mr. Lescarboura, the secretary of the committee, gives a very interesting summary of the history of the investigation, and also of the history of the E R A cult. Anyone interested in the subject may be strongly advised to read this article. The publication of this report places the electronist practitioners in the following position. They are earning a living by diagnosing and treating sick people with certain expensive machines. The principles on which these machines are supposed to work violate the known laws of physics and medicine. Their claims have been investigated by a strong committee, appointed by a journal which has a high repute and can claim complete impartiality, this committee has worked for a year and has offered opportunities to all the recognized leaders of the cult in America to display their powers. The finding of the committee is not that the electronists have failed to prove their full case, but that they have failed to prove any case whatever, and that the whole business is at best an illusion.

LONDON SCHOOL OF MEDICINE FOR WOMEN

As already announced, the London (Royal Free Hospital) School of Medicine for Women (University of London) will celebrate its jubilee in October. The school was opened through the initiative of Sophia Jex-Blake on October 30th, 1874. Thirteen students then began their medical studies. The first council of the school included some of the most distinguished men and women of the day, the Earl of Shaftesbury, Charles Darwin, Professor Huxley, the Dowager Lady Stanley of Alderley, and Dr. Elizabeth Garrett Anderson being of the number. Since the foundation over one thousand women have qualified from the school. The jubilee celebrations will include a service of thanksgiving for the opportunities of training, work, and service opened to women in the last fifty years, at St. Paul's Cathedral, on Saturday, October 25th, at 2.30 p.m., a dinner at the Guildhall on Friday, October 24th, at 7.30 p.m., and an evening party at the medical school on Saturday, October 25th, from 8 to 12. In connexion with the jubilee it is hoped to raise an endowment fund of £60,000 to provide chairs in anatomy, physiology, and pathology, to bear the names of three women pioneers in medicine —Elizabeth Blackwell, Elizabeth Garrett Anderson, and Sophia Jex-Blake. Of the sum needed £22,000 has already been given and promised. Her Majesty the Queen has graciously made a donation to the fund. The honorary treasurer is Sir Alan Garrett Anderson, K.B.E., 5, Fenchurch Avenue, E.C.4, and the organizing secretary of the endowment fund is Miss K. Balfour Duffus, at the Medical School, Hunter Street, Brunswick Square, W.C.1.

A MEDICAL REVIEW OF SOVIET RUSSIA

III—SCIENTIFIC WORK

BY

W HORSLEY GANTT, B Sc, M D,

FORMERLY CHIEF OF THE MEDICAL DIVISION OF THE AMERICAN RELIEF ADMINISTRATION PETROGRAD (LENINGRAD) UNIT

SOVIET ATTITUDE

WHILE the Soviet Government has attempted to make its institutions proletarian, it has at the same time endeavoured to foster science within its borders, and it has not entirely failed to accomplish its purpose in either of these respects Although laboratories and schools are much poorer than formerly, and although scientists as well as others have undergone severe privations science in Soviet Russia has kept up to its former high standard, and, paradoxically, has even prospered

There are many who will take the view that scientific progress has been made in spite of the Bolsheviki, that they have hindered rather than furthered its advancement, and that all the progress has been due to the zeal of the Russian scientists Of their zeal there is no doubt However, from my contact with various Communist officials in different parts of Russia I believe that they are fully aware of the importance of science, not only to humanity and materialistic achievement, but to the success of their government, and I found that nearly all of them took a genuine interest and pride in the scientific institutions of Russia I have been impressed many times with the wholehearted support and sympathy which they give to these places I do not mean that the scientists have not worked under enormous economical disadvantages But my feeling is that the Soviet authorities have done what they could with their limited means to keep science alive and to encourage its growth when this has not conflicted with their political principles The elevation of science, I might say its deification, is more or less part and parcel of their political philosophy, for the deification of natural science fits in well with the materialistic theories of Marxism The present Government also desires particularly to increase the domain of applied science in Russia

Like most other things in Russia all scientific institutions are supported entirely by the State In the process of "nationalization" they lost their former sources of income, and receive rations, salaries, fuel, etc, from the State

As I was not in Russia before the revolution I am unable to give a first-hand comparison of the condition of science in Czarist Russia The present actual financial resources are less than formerly, but certain new expeditions have been financed by the Soviet Government and researches in many domains have been undertaken A few of the professors have been sent abroad for study or conference—for example, Pavlov and his son were given £350 for their trip abroad last summer Being unfamiliar with conditions in Russia under the Czar, I shall give my impressions of the attitude of the Soviet Government towards science rather than an accurate comparison

RECENT SCIENTIFIC PROGRESS

In the following account I shall mention some of the lines along which science has made progress in Russia, and go into some details regarding the work of Pavlov the greatest of all Russian scientists on trophic nerves and on the sympathetic system but before going into these scientific medical accomplishments it may not be out of place to mention briefly some of the scientific work being done in other fields

Physics—In physics Professor Pojdestwensky Leningrad working by means of spectral analysis on the construction of the atom, has reported the discovery of the construction of the atom of lithium

Hydrology—A polar expedition of thirty two scientific explorers set out in August 1921, and spent six weeks in cruising in the Arctic and making hydrological and biological observations Cod and other fish were found in latitude 69 deg longitude 57 deg This locality was formerly supposed to be too far east and north for the codfish Marine temperatures and other observations of this nature were made, and found to differ from previous record

Archaeology—An archaeological expedition went to Mongolia, to last three years, started in 1923 under the explorer P K Kozlov Many objects of art statues, paintings, and 2,000 MSS have already been brought back into Russia from Kharo shote, they are memorials of a desert culture now extinct

M Pokrovsky, assistant commissar of education, says of this expedition

> In calling to life the sleeping consciousness of the people of the East Tartars Turks etc the October revolution has created a number of new interests in ethnographical and historical spheres And now with the money of the Tartar Republic born after the revolution are being organized archaeological expeditions to the ruins of the capital of the Turco-Tartar empire In the ruins of these capitals we find a picture which destroys the common notion of the savage nomad capable only of plunder Now the history of Central Asia will have to be written according to a new plan

Wireless—Progress has also been reported in wireless telegraphy M Pokrovsky, *in his book on science in Russia* for the last five years says *In general the development of the electrical industry of Russia is progressing speedily, it is as yet the only industrial sphere in which industry has risen 50 per cent higher than it was before the war"*

Vaccines—In the preparation of all medical equipment and pharmaceutical supplies Russia has always been far behind other civilized countries *Small pox cholera and* other vaccines and diphtheria antitoxin are, *however* being manufactured on a large scale in Moscow and Leningrad The quality of these was inferior to those manufactured in other European countries In connexion with this the work of Belanotsky at the State *Medical Institute* is of interest Working along the same lines as Fourneau at the Pasteur Institute in Paris he has perfected the preparation of a cholera and typhoid vaccine to be given by mouth in pill form I hear from Dr Belanotsky that this *form has been tried in several thousand cases in the Red* Army, and found to be as efficacious as the subcutaneous method of vaccination

THE WORK OF PAVLOV AND HIS COLLABORATORS

The greatest progress has been made in physiology by Pavlov and his pupils (chiefly Orbeli, Foorsikov, Savitch, Volborth, and Studenkoff) in Leningrad

CONDITIONED REFLEXES

The recent work of this school on "conditioned" reflexes, sleep, and heredity have already received attention in the BRITISH MEDICAL JOURNAL[1] Most of this work on the conditioned reflexes has been proceeding during the last twenty years, but, until last summer, when Professor Pavlov attended conferences in Europe and America it did not receive general attention abroad owing to Pavlov's reluctance to submit for publication work which he does not consider completely or thoroughly verified His other important work on the trophic nerves and sympathetic innervation is generally unknown outside Russia*

The information concerning the work of Pavlov's laboratories has been obtained from the following sources (1) Bi-weekly visits to the Pavlov laboratories during eight months of my stay in Leningrad in 1922 and 1923, (2) frequent conversations with Professor Pavlov in his laboratories and in his home, (3) a reprint of Professor L A Orbeli's work on sympathetic nerves and a copy of a lecture by Professor Pavlov received from him in April 1924 in response to my request to him for details of his work on these subjects, (4) frequent conversations in May, June, and July, 1924, with Dr Babkin at University College, London, who worked in Pavlov's laboratories for ten years, to him I am indebted also for help in the translation of Pavlov's papers (5) conversations in June and July, 1924, with one of Pavlov's pupils direct from Leningrad I am indebted to Dr J W McNee for various suggestions as selection of the material which I have collected

* In evidence of Professor Pavlov's interest and leadership in this work he told the writer that he had given a course of lectures two years ago summarizing his thirty years of experimental work on the nervous system Many were not available at the time and later should be subjected to the brutal criticism that he felt that if it had been written he would find it necessary to change the whole presentation desirable

[1] BRITISH MEDICAL JOURNAL, 1923, ii, 1169.

SYMPATHETIC INNERVATION

Langley and other physiologists had taught that the sympathetic system controlled only the viscera and involuntary muscles The work of Orbeli, Babkin, and others of Pavlov's pupils has shown that the sympathetic has other important functions, Orbeli has demonstrated the sympathetic innervation of striped muscle, and Babkin the effect of the sympathetic on glandular secretion Pavlov has recently come to the conclusion that all organs and tissues are under the control of special trophic nerves which are independent of the vasomotors

Two years ago it was pointed out by Professor Orbeli, who is chief of the physiological laboratory of the Leningrad (formerly Petrograd) Medical Institute, that there was a direct relation between striped muscle and the sympathetic nervous system, and that striped and cardiac muscle were related functionally, the chief difference being quantitative The sympathetic nervous system produces the same effect on skeletal as on heart muscle—namely, inotropic, dromotropic, bathmotropic, and tonotropic results* In heart muscle the sympathetic nervous system produces physical and chemical changes which express themselves in an alteration of the properties of the muscle—increase in irritability and of the strength and height of contraction, increased excitability and conduction, a shortening of the period of refractibility, etc It is necessary to explain the effect of the sympathetic on increased heat production and also on the chemistry and function of the muscle Although the task of finding answers to these questions has not been completed, Ginetsinsky, working under Orbeli, has furnished a tentative solution which Orbeli considers correct The following account is the summary of a paper received recently from Orbeli on this subject [4 5]

The Effect of the Sympathetic on the Function of Muscles

Ginetsinsky[6] used the isolated gastrocnemius of the frog, after depriving it of blood without destroying the nervous connexions He recorded the effect of stimulation of the roots of the eighth and ninth spinal nerves, and at certain intervals he tried the effect of stimulation of the neighbouring fibres of the sympathetic at the level of the seventh ganglion At the beginning of the work only threshold stimulation of the motor nerves on unfatigued muscle was employed, and the results were uncertain, but later better results were obtained by stimulating the sympathetic while fatigue was beginning to develop or had fully developed as a result of the stimulation of the motor nerve He concludes that the function of greatly fatigued and contracted muscle is gradually restored by this sympathetic stimulation The effect begins after a long period of latency, increases gradually, and reaches a maximum soon after the cessation of the stimulation of the sympathetic, and lasts a long time, in fact, in many cases the period of revived muscle ability continues longer than the initial period before fatigue When fatigue has developed through the occurrence of several contractions, and has manifested itself by alternating, strong, and failing contractions, the sympathetic has a compensatory effect and causes both the disappearance of arrhythmia and uniform contractions of average strength Equally impressive results were obtained regarding the isometric ability of the muscle

In a series of control experiments he showed that when isometric tetani lasting five seconds with intervals of fifty-five seconds were repeated there occurred invariably with each contraction a diminution of the muscle tension If, however, after the second or third tetanic contraction the sympathetic nerve was stimulated, during this stimulation, and for a long time afterward, there was either very slight diminution of tension, none at all, or even a greater tension than that shown in the earlier tetanic contractions, in addition, every contraction was characterized by greater stability In other words, under the influence of the sympathetic the muscle develops contractions which are greater in both intensity and duration

This furnishes a complete analogy to the heart muscle In both the heart and striped muscle sympathetic stimulation produces an increase in amplitude and intensity of contraction, an acceleration of the act of contraction, and a compensation of the dissociation between the rhythm of the irritation and that of the reacting contraction—that is, all the data necessary to the proof of inotropic, bathmotropic, and dromotropic effects In both cases there is a long latent period, a gradual development, and a long after effect, and in both the effect is weak in the fresh healthy organ, but is very marked in the hypodynamic tissue, and the strength of sympathetic stimulation, which is essential for restoration, is about the same in both Summing up, Orbeli says

> "The direct influence of the sympathetic nerves on the skeletal muscle is fixed beyond doubt, the universal significance of the sympathetic innervation is proved, the relation of the autonomous nervous system to the generalized muscular formation is shown, and the ability of the autonomous fibres to alter the condition of the muscle and its contents become transferred from a small organ, the heart, to the whole skeletal muscle, thus fulfilling the prophecy of the 'chemical tonus' of E Pfluger and of the 'trophic innervation' of Pavlov The sympathetic system, which guides all the vital properties of the muscles and secures for them the greatest use of their reserve strength, *must also affect their tone and metabolism*"[4]

PAVLOV'S VIEWS ON TROPHIC NERVES

Although the experiences of clinicians, and especially of surgeons, have for a long time tended toward a belief in trophic nerves, physiology has been unable to demonstrate their existence The surgeon often sees such evidence of trophic disturbances, but physiology has lagged behind in the explanation of these phenomena All that physiology could say was that these conditions were produced by changes in the blood supply effected through the vasomotor fibres Pavlov has, however, leaned toward the view of the clinicians for many years, although he could not explain it in the laboratory, and recently he has demonstrated the existence of independent trophic nerves to several organs and tissues

Long ago both Gaskell and Pavlov showed that in the heart, besides the vasomotor nerves and the pair of accelerator and inhibitory nerves, there is another pair of trophic nerves After years of observation, both clinically and in the laboratory, and his recent laboratory work, he now advances the view that there exists for other organs and tissues three classes of nerves, not only functional and vasomotor nerves, but a third class—the trophic nerves, which control the amount of material used in each organ of the body

In Pavlov's own words—

"The medical observations of life have an extensive horizon, whereas the physiologists, having to go only by the figures that they find in the laboratory, have a much more restricted outlook Hence the nonconformability between all that empiric medicine knows, sees, and makes use of and that which physiology can reproduce and explain Here can be placed shock and trophic nervous phenomena No explanation of shock is universally recognized, and trophic phenomena cannot be observed in the conditions of exact experiment

"In my laboratory, though not experimentally, but clinically, I leaned toward the views of the clinicians about the existence of special trophic nerves In the course of many years, while operating on the digestive tracts of animals, I often unexpectedly observed strange symptoms in the animals that lived I noted trophic disturbances, tetany, paresis, ascending paresis, and shock which had two issues—either death or temporary lethargy
